Another record broken, which we may well wish had remained as it was, is the record for no loss of life, or, indeed, serious injury among the hunters. For many years the list of accidental deaths in the woods from mistaking someone for a deer has been large, far too large for the timid to take any chances with, and so many have been kept from the woods who would, otherwise, have ventured on a hunting trip. With the passing of October it was noticeable that no one had thus far been shot for game, and it was earnestly hoped the slate would remain clean. Hardly had the wish been expressed before word came of an awful accident on Mud Brook, about seven miles above Stacyville, by which George H. Spinney, of the latter place, had been seriously wounded. Spinney was guiding E. C. Lewis, of Cambridge, Mass., who has been making trips into the Maine woods for many seasons and ought to know better than to take any chances in deer shooting, especially when he doesn't know the exact location of his guide. Yet, after he and the guide had separated, and he saw a bush move, he blazed away with his .40-72 high velocity rifle, and the bullet struck Spinney in the leg, almost up to the groin, shattering the bone and making a very serious wound. For two hours or more the wounded man was obliged to lie in the snow and suffer while Mr. Lewis, who did what he could before leaving, was gone to the camp for aid. A physician was summoned from Sherman, and everything possible done at the camp to relieve Spinney's suffering, and as soon as possible he was brought to Bangor, where he is in the Eastern Maine General Hospital, while the surgeons are wondering how they will be able to save his leg. Mr. Lewis is in town with him and seeing that he has every possible comfort and attention, and the wardens have investigated and reported the case to the Commissioners, who may decide to prosecute the sportsman under the law specially provided in such case, and under which no judgment has yet been pronounced by a Maine court.

In the great number of heads secured by sportsmen of the past week or so, there are a few deer heads deserving of special mention, which have come to the writer's personal notice, although there are very likely some quite as good taken through to out of the State points, that have not been examined by your correspondent. To get such specimens as these is worth almost as much as to get a moose head, and, in fact, there have been secured deer heads in Maine that brought three times what a fair, every-day moose head, well mounted, would bring. Perhaps the most striking of these was one secured by John Cameron, of this city, and, by the way, the finest sets of deer antlers seen in Bangor this fall were from deer shot by residents of the State. This Cameron head was a re-

markable specimen, spreading 28¾ inches and having 19 points, a head that would have to be seen to be fully appreciated. Perhaps second in beauty, but far more irregular in the direction of the points, yet singularly regular in having the same variations on each horn, was that secured by E. C. Parker, of Bar Harbor, and who hunted on Machias River waters at a camp on Crooked River. The horns had 21 points, and would spread about 20 inches. The buck that bore this kingly crown was a monster, weighing 240 pounds, dressed for shipment. Perhaps the widest spreading antlers of these big deer sets were those on the deer shot above Sherman by E. N. Outhouse, of that town, and who is having them mounted to present to a sportsman friend. Those horns spread 29½ inches, and bore but 12 points, those points, however, being very long and graceful, and evenly arranged. The fourth striking head is one secured by O. A. Cowan, of Kingman, and is almost like a bush, so narrow is the spread of the horns and so close together the points, which are of exceptional size, almost, indeed, deserving of the term massive. There are 18 well defined points, and a peck basket could readily be placed over the horns, covering them completely.

The members of the Forest City Hunting Club who have been in Maine this season to try once more their success in hunting Maine game, have gone home to Cleveland, O., without a moose, but they have had a splendid time in the Ox Bow region, where they went this time. In the party were President Mark Hutchison, Secretary H. E. Doty, H. C. Hutchison, Dr. M. A. Able, S. A. Hand, and U. J. Smith, and they carried home twelve deer, having been in camp three weeks.

Landlord H. E. Capen, of Augusta, has gone home from his camp on Deer Island, Moosehead Lake, with a fine moose, which he secured in the woods above the lake.

Wm. H. Trotter, of Philadelphia, who is a thorough sportsman, but is most ably seconded by his wife, who is ready to rough it if need be to secure her trophies, has returned with her from the Eagle Lake trip, and brought out two moose heads and three bucks.

One of the very nice heads killed in Maine this fall has lately been brought out from Van Buren by I. N. Chase, of Malden, Mass., and measured 54 inches spread.

E. T. Price, of Philadelphia, who made the Allagash trip with A. W. Wister, Jr., of the same city, was among the very fortunate sportsmen who secured a fine moose head, and has gone home delighted with his month's outing in the Maine woods.

Others whose trips might be mentioned at more length, but for lack of space, are: L. A. Chatman, of Boston, who brought out a moose from Portage; H. D. Sears, of Lynn, Mass., whose moose came from up the line of the B. & A. R. R.; Abram W. Sargent, of New York, who was in the territory beyond Patten, and brought out a moose; Dr. W. Francis Decker, of Philadelphia, who went into the Big Machias waters above Ashland; George Killam, of Dresden, this State, who took his moose out from Patten, and many others.

One of the noticeable features of the season's sport is the number of white deer, three having been sent to one taxidermist establishment in this city to be set up whole.

The commissioners report that they have sold 1,300 non-resident licenses this season, and those in the woods will now look for a great increase in the warden service, as the announcement concludes that the money derived will be enough to keep twenty more wardens in the woods throughout the year.

HERBERT W. ROWE.

Me en Ellick en Ben.

"ELICK, pa jes now tole me dat a lot er rich Yan-kees was comin' to Mis' Corry's dis eb'nin ter hunt er hole week, an' dat Mis' Corry wan' 'im ter bring ole Ben ter-morrer en go huntin' wid 'em, but he say 'e gotter ten ter 'is corn housin' en can' go, en 'e wan' me ter take de dorg! You wan' go?"

"Yas, but yer reck'n dey gwine let us go huntin' wid em?"

"Dono, but er reck'n dey'll let us go 'long en hole de hosses en tote rabbits. Ennyhow, you came en go wid me in de mornin', en when dey fines ole Ben won' stay wid 'em dout I'm 'long ter keep 'im, er reck'n dey'll let us go wid 'em. You come up early'n de mornin', ennyhow."

The above conversation was held one crisp November afternoon at the back door of an old Colonial mansion in Culpepper county, Virginia, between the writer, then a boy about twelve years of age, and one of his colored playmates, the son of "Unc' Buck," the old family house servant, who, thank God, is yet alive, although nearing the century mark.

As with all Southern country boys, my playmates were the negro youths on the farm, and in conversing with them, invariably the negro dialect was used, and generally on all other occasions also, unless on "company manners," when very little of anything was said, unless addressed, and then replies were delivered with painful bashfulness.

Hunting, however, although I did not carry a gun, except surreptitiously, that being expressly forbidden, was then, as now, my favorite recreation, and there was no greater pleasure in life than riding double behind my father on his numerous shooting jaunts about the neighborhood, unless it was hunting and running "rabbits" with the negro boys, old Ben and numerous and sundry "niggers," curs, between whose owners and myself the question of who possessed the fastest rabbit dog was ever a bone of friendly contention. But old Ben was hard to beat. He was a large, almost solid liver pointer, without any pedigree whatever, but when out with my father, no better quail dog could be found in the State. I knew it then and I know it now, in the light of much after experience, but just let him go hunting with me and the "boys." My! it was good-by to Miss Molly, if she couldn't find a groundhog's hole, and he paid no more attention to quail than if he had never seen one. Ellick, whose full name was Alexander, was also, in one respect, a very remarkable boy; he possessed a wonderful ability for throwing rocks, and many a hare have I seen him knock over as he attempted to pass him with every muscle working overtime to keep ahead of Ben, who, with short, anxious, almost whining yelps that made your every fiber tingle,

was reaching for her at every leap. Those were great and glorious days, and many a ringing and merry laugh I've had when a hare, just as we thought her caught, would suddenly double in her tracks, and over the dog would go in a somersault in his frantic effort to seize her as she darted under his snapping jaws. But up and after her he would go at once, and of Miss Molly's troubles he would soon relieve her, unless she quickly found a sanctuary in some hole or a rock fence. The latter, of course, entailed a partial destruction of the fence.

As agreed, early the next morning, Ellick saddled up old Sam, still wearing the honorable chevrons he earned in the Civil War, a "U. S." branded on each shoulder, and mounting double on the old war horse, we started for the adjoining farm.

"Mis' Frank, whut dem Yankees wan' old Ben fur, ain' dey got no dorgs er dey own?"

"Er dono whut dey wan' 'im fur, 'cause pa says dey got de fines' dorgs yer eber see, dey got sum dat coss more'n er hundred dollars, en dey puts blankets on em jes' like Unc' Tom do on 'Supprise' en de udder bluded hosses. Dey mus' be good dorgs, dough, 'cause ole Ben didn' coss nuff'n, en dar ain' no dorgs roun' here dat kin beat 'im much."

"Dat de truf, sho's yer born, 'cep'n hits my ole dorg Jim."

"Yon dem dorgs now. Look at dat white setter dorg, he look like he jes' ben wash, now."

"Ya, en er reck'n dat's dey brag pinter dorg up dar on de poach what hole he haid so high, like he gwine fine pattergies in de trees."

"Goo' mor'n, Mis' Corry."

"Good morning, Frank, where's your father?"

"He could'n com' ter day, sur, cause 'e's git'n 'is corn in, so 'e saunt me'n Ellick ter bring ole Ben, en 'e tole me 'e reck'n me 'n Ellick hed better go hunt'n wid yer, 'cause Ben would'n stay wid yer ef me 'n him didn' stay."

"Say, sonny, is your dog a good one?" (this from one of the visitors.)

"Yassur, he rite good kinder dorg."

"Will he find quail and hold them?"

"Yassur, he kin fine 'em, en 'e stan' 'em orrite, too."

"Will he chase hares?"

"Yassur, sumtime he do, when 'e go rabbit hunt'n wid me 'n Ellick, en 'e kin kech 'em, too."

"Well, we do not want a hare chasing dog along, he will ruin the day's sport."

"He ain' gwine run 'em ef 'e no yer hunt'n birds."

"Very well, I guess you can come along and show us where the quail are, as Mr. Corry cannot go, but we are going to show you to-day what good dogs are, sonny."

"Yassur, ole Ben ain' gwine bother yer none, er reck'n."

So off we went, each visitor mounted, Ellick and I on Sam and the city dogs galloping over the field in a wild, joyous, aimless fashion, heads up and tails going a lively clip, which I learned was great style, a term until then unknown to me. They were certainly merry goers, and the way they ate up the ground was destined to put them out of the game at an early hour. But no birds, of course not—we were crossing a closely grazed blue grass sod, which old Ben well knew, and seeing the direction we took, he leisurely trotted a short distance ahead, leading the cavalcade to Smith's "old field," in those days a paradise for quail and hares. As we approached the "line" fence, over it the city dogs leaped and wildly they bounded through ragweed and underbrush, putting up one covey before we got down the "draw-bars" and paying absolutely no attention to the constant blasts of the whistles, which were to me an innovation, as the "Hie on!" "Steady!" and sassafras switch were the only training accessories with which I was familiar. The old brown dog crawled under the fence and then got down to business. He knew every inch of that field, far better than I, and very shortly it was:

"Hey! dar dey is, ole Ben got 'em," and sure enough, there he was, frozen stiff, on a ditch bank. Then such calling of dogs to "back" you never heard. Up came the white setter and rushed pell mell into the bevy, receiving as a reward therefor a look of surprise and contempt from Ben and a sound whipping from his owner. Such shooting you never saw—eight shots and only one bird to show for them, and out of all the din came Ellick's surprised ejaculation:

"Law! Mis' Frank, ain' no smoke come out'n dem guns."

And that was true; I had then my introduction to smokeless powder. Then followed flush after flush as the city dogs rushed wildly about, putting up bird after bird, each rise bringing forth a volume of execrations, the only redeeming feature on that covey being two undisturbed points by Ben, and his stock at once went to par.

"Dem dorgs ain' no 'count, nohow. Dey better take 'em home en let ole Ben hunt fur 'em. He ain' gwine run in de birds dat 'fool way."

"Dat so, Ellick, but dey ain' gwine keep dat up long. Dey gwine break deyself down 'fo' twelve er'clock. Er reck'n dey think ole Ben wuff rite smart by now."

As predicted, so it happened, and long before twelve o'clock all the high-bred hunters had been sent to the house, and from then on there was excellent sport over the country dog, who put up during the afternoon several of the grandstand plays, for which he was so famous in that neighborhood.

Only one event interrupted the sport, and that was the most exciting of the day for Ellick and myself. In going from one hunting ground to another, we were crossing a large open "new ground" field, with little cover, in the very middle of which the dog jumped a hare. The prospect of such a sight race was too much for our decorum, so down from the horse we slid and "hied on" and "whooped up" old Ben, and the fun we three had was something great. Straight up the nearest hill, the dog close behind, went the rabbit, and just as we thought her finished, she doubled, sending the pointer completely over on his back. Down the sheep path, in which I was following, she came, ears flat and eyes sparkling with fright, and instinctively

I stooped and held my old black, slouch hat right in the path. Thinking it a hole, Miss Molly dived right into it, and over went rabbit, hat and boy in a cloud of dust, as I made a frantic effort to get my hands on her, but through them she slipped, down the path and up the next hill she went like a streak of lightning, old Ben now again close at her heels. But the pace was too hot for her, and again she doubled, and, passing the line of horsemen, even they forgot their dignity and lustily cheered the race. But the old lady's end was near, for her course took her within twenty yards of Ellick, and a flying stone striking her head, ended her mad career.

The excitement over, I awakened to the scandalous breach of ethics and commenced to stammer some crude apology for both the dog and myself, but one of the men cut me short with, "That's all right, Bud, I would not have missed that chase for all the quails in the State."

That was a great day's sport, but it had a sad ending for me. The hunt terminating on Fleetwood farm, the most direct way home for Ellick and myself was through Brandy Station, and as we had been given all the hares shot that day, the temptation to trade some of them for ginger cakes and stick candy was too great for our youthful ideas of sportsmanship.

Meeting my companion the following morning in the cow pen, the following conversation occurred:

"What yer ben cry'n 'bout?"

"Pa lick me las' nite."

"What he lick yer fur?"

"Caus'er sole dem rabbits down Brandy yestiddy."

"He didn' lick yer much, did 'e?"

"Yas, he lick me wus'n 'e did dat time I cut off de tails er all dem 'Yorkshur' shotes en 'e took mer nife erway."

"Er don' see how cum 'e lick yer, he must' er ben jes' mad so."

The cause of that whipping is still a mystery to Ellick. FRANKLIN STEARNS.

A Deer Hunt in Java.

WHILE Ferrari, my landlord, and myself were detained at SAGRANTEU, awaiting the reports from scouts sent to locate a female rhinoceros and young one, we received an invitation from an old Hadji to visit him and enjoy a deer hunt, which he would arrange for our especial benefit. Accordingly, we journeyed over to the Hadji's abode, and found everything prepared for our amusement and comfort. As the house was quite a small one, I wondered where our sleeping quarters were located, and was surprised to find how easily the problem was solved. The roof of the domicile projected some eight or ten feet beyond the front wall, so as to form a porch along the entire front of the building. A couple of bamboo mats were hung at each end of the portico, two more, about six feet in width, were pendant along the front, and a curtain from them back to the front wall completed two unique dormitories, with our beds laid on the floor. It was late in the day when we arrived, and we found that the Hadji was engaged, reciting his usual afternoon prayers; but he soon made his appearance from the diminutive building, which was used solely for that purpose, and stood but a short distance in front of his house, under the shade of a magnificent Palmyra palm tree. He immediately started several of his attendants to give notice to his neighbors to be on hand at an early hour the next day, to assist in detecting traces of our timid game.

We had just finished our evening meal, and were seated in front of the house enjoying our cheroots when one of the Hadji's retainers put in an appearance, and after salaaming, announced that a wild boar had just been driven out of the rice patch, and as it would be very apt to repeat its pillage, he suggested the propriety of constructing a trap for its capture. The Hadji gave orders for its immediate construction, and before bed time it was finished, and carried down and deposited close to the hole, which the depredator had made through the fence, enclosing the patch. It was constructed of bamboo, and was simply an elongated affair, with a trap door at one end, and trigger at the other, so that the animal would strike it in turning to retreat by the same passage, by which he had obtained entrance. While breakfasting the next morning a messenger put in an appearance and reported that the robber had been detected foraging in the patch, and the hole, by which he had entered, was closed, without putting him on his guard. Hastily finishing our meal and lighting cheroots, we hurried off down to the patch, when the trap was placed in position, and the gap reopened. The attendants then clambered over the fence at the farther portion of the inclosure, and soon had the robber hurrying for the opening, through which he plunged, without divining the trap that had been arranged for his capture. So soon as he discovered how he had been duped, he made furious attempts to scape, and it required several men to hold the trap down, while others passed three bamboo poles underneath and lashed them fast, so that the crate could be carried to the house. During the entire day he never ceased his attempts to escape, and the next morning, much to my sorrow, was found with his neck broken. The Hadji seemed as much grieved as myself at the unfortunate termination of the affair, and promised to use every effort in his power, to secure for me another specimen before my departure from the neighborhood. He succeeded and sent me a pair of young ones. This I considered the acme of politeness, as Mahometans look on all of the porcine family with a loathing equal to that of the Israelites.

It was late in the afternoon when the scouts returned and reported that they had discovered the whereabouts of a pair of deer, and on the following day would place Ferrari and myself in well-screened positions, from which one or both of us would be likely to get a shot. Our breakfast was finished at an early hour the next morning, and under the guidance of the scouts we were taken about half a mile distant and placed in carefully constructed ambushes about 300

yards apart, located on the border of a jungle, fronting on a beautiful meadow, which was used as a pasture for the Hadji's buffaloes. The scouts then separated into two parties, going in opposite directions, with the intention of penetrating the jungle about half a mile on each side of us, forming a semicircle around the game, and then driving it out into the meadow. For some time I had been watching a Javan parakeet, whose peculiar note had attracted my attention, when I saw it show evident signs of uneasiness, which culminated into a rapid flight beyond my vision.

Remaining perfectly quiescent, in expectation of seeing a deer, I was startled by the appearance of a wild dog, sneaking along under the thickly grown undergrowth. Just then, several grunts caused me to look aloft, when I was surprised to see a troop of silvery Gibbons approaching along the branches of the surrounding trees, and evidently bent on annoying their canine enemy. They congregated just above the dog and indulged in all sorts of insulting antics, frequently descending so low that he made several attempts to spring up and catch them, which were always evaded by their surprising agility. I became so intensely interested in their movements that I became oblivious as to the cause of my being so thoroughly secreted, when it suddenly struck me that to succeed in my original purpose it would be necessary to rid the vicinity of the intruders. Suddenly rising up in full view of both parties, I was highly amused at their frantic efforts to depart from my immediate neighborhood. The dog gave an angry growl and dived into the closely packed undergrowth, while his tormentors gave an exhibition of flying trapeze performances that would have amazed their human imitators. It required a strong effort on my part to prevent myself from bursting out into a hearty laugh at their frantic efforts to get out of my sight, but the consciousness of preserving complete silence, in order to succeed in my attempt to secure my game, caused me to again sink out of sight with the least possible noise.

I had been quiet for a comparatively short time when I detected the sound of something stealthily passing through the jungle, on my extreme right. Softly lying down and peering through the stems of the undergrowth, I caught sight of a deer's feet slowly moving along toward the edge of the jungle. Waiting a few moments, I suddenly rose up with my Winchester at my shoulder ready for a snap shot, when a buck's head was thrust through the foliage, about fifty steps distant. With the crack of the rifle it vanished, and by the floundering which followed I judged that my bullet had flitted truly, and cautiously pressed forward to ascertain if my surmise was correct. To my great satisfaction I found the body of a male Rusa deer, with a bullet hole just between the eyes. I had but a short time for self-congratulation before I was joined by several of the scouts, who had been attracted by the discharge of the rifle. They were just in the act of lifting up the carcass when the report of Ferrari's rifle was heard, and I secretly hoped that he had been as successful as myself. When we reached the edge of the jungle the body was laid on the grass that I might have a good look at my game, and on examination I was struck with the resemblance, in several points, to our elk or wapiti deer. Ferrari soon joined us, and I was sorry to learn that his shot at the female was unsuccessful. The body of the buck was again lifted on to the shoulders of the scouts, and we made our way to the Hadji's house, where one portion was reserved for our host, another for the Raden Sastra Soedibdja, and the balance handed over to the retainers, who had so cleverly arranged the hunt.

We then seated ourselves to enjoy a meal of curry and rice, and were just finishing when a messenger arrived and handed the Hadji a communication from the Raden, announcing the location of the female rhinoceros and young one, by the Raden's scouts. The message consisted of a joint of bamboo, on which was scratched, by the point of a knife, the interesting news, which taught me a new addition to the multi-form uses of this wonderful wood. Bidding the Hadji farewell, we returned to SAGRANTEU, where we found that the Raden had made all the necessary preparations for our immediate departure for the neighborhood of the mother and her youngster.

FRANK J. THOMPSON.

Willard Ames Drowns a Buck.

NEW YORK, Nov. 12.—*Editor Forest and Stream:* I know how loyal and just you are in the line of and protection of game, and I think I was never more disgusted in my life than on reading the inclosed article, which I clipped from the New York Sun of Saturday last. A more brutal and inhuman action I never read of, and I only wish there was a law that could reach and punish such men as the perpetrator of this deed.

UTICA, Nov. 6.—Miss Kate Buttrick and her escort, Willard Ames, both residents of Malone, and members of a house party at Indian Lake, in the Adirondacks, were standing on the shore of the lake early Wednesday morning, when they saw a large buck in the water, twenty yards off. They lost no time in getting into a boat, and although they had no gun they went after the deer with the purpose of getting it, and they succeeded.

"Keeping the boat between the deer and the shore, they so tired it that it made little resistance when Mr. Ames seized it by the horns and kept its head under water until it was drowned. The buck was then towed to the dock in triumph, where the assembled guests, who were watching the struggle, warmly congratulated the occupants of the boat on their success. The buck weighed nearly 200 pounds."

I trust you will take this matter up and exploit it in your paper, so that all true sportsmen may see it, and in that way the perpetrator of this inhumanity may be reached, if not legally, morally. L. W. JOHNSON.

All communications for Forest and Stream must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

New York Non-Resident License.

ROCHESTER, N. Y.—*Editor Forest and Stream:* One of the amendments to our game laws which I think the League should urge is that all non-residents shall pay a license fee. The present license provision is not enforced. Recently I was informed through the Commissioner's office that not a single fee has been collected or license issued this season. Thirty-two States now require a resident of New York to pay a license of from \$10 to \$25, but two States, Delaware and Washington, being less. It will scarcely be claimed that any non-residents have not both hunted and fished in this State this summer and fall, and the States of which they are residents require a license fee from a resident of New York. It seems clear that our State should have a regular license fee for a non-resident, free from all provisions and conditions. Our game is not so plentiful that we can furnish sport for all non-residents of this continent as we have been doing.

Mongolian, Ring-Neck and English Pheasants.

The law protecting these birds expires with 1904, and such being the case, ought not the same to be amended at the coming session of Legislature? If there is to be an open season for them I would suggest that it be not more than five or ten days to begin with, for a few years, and say from November 1 to 5th or 10th, and then let the barter or sale, etc., be prohibited.

Section 27 should be amended so as to include quail killed in this State, and I think the word bartered should be inserted before the word sold, as to all these birds.

A Gun License.

It is frequently suggested that there should be a gun license. I am somewhat of the same opinion; if so, I think it should be graded. For instance, \$1 per annum for permit to carry pistol, revolver, single or double-barrel shotguns and rifles, and \$3 for pump or magazine shotguns and \$5 for automatic magazine shotguns. As it is now, guns are so cheap that boys and irresponsible men—and especially foreigners who cannot even speak our language—carry a gun and shoot any and all birds they can find, and especially on Sundays in many vicinities.

J. R. F.

Idaho and Washington.

KELLER, Wash., Nov. 12.—The 25th of July I left camp for the St. Joe country in Idaho, where I spent over two months and had a good time hunting and fishing, gathering huckleberries, and a nice time generally. I got back to camp in October. The boys tell me that birds have been more plentiful this season than at any time since the opening of the reservation. I think this can be accounted for by the fact that little spring shooting was done. People have begun to find out that if they shoot in the spring they will not have any birds to shoot in the fall. Deer are not very plentiful, although there are some around. The birds Forked Deer calls apple birds are what we call black woodpeckers. They make their appearance the first of May, rear their young, and leave about the last of September. They are very destructive to cherries, and do damage to all kinds of fruit by pecking into any they can reach. Some kinds of apples they work on more than others. I have seen some of Mr. Campbell's apple trees covered with them. They nested in some old pine trees in my garden for a few years, and I did not molest them till I found that they were so bad on fruit. Last year I set out some trees, among them two cherries; this year there were nineteen cherries on one tree and I wanted to see what kind they were. I had to put a sack over the tree to protect them. In this way I saved them, and I have been killing all the birds I could from around the garden.

The other day I was over on the west side of the San-Poil, and the miners told me that a few days before they had seen a nice flock of Bob Whites. I think the quail will do well along the San-Poil, as there are lots of thorns as well as rose bushes covered with hawks, which supply food for all the quail and grouse families. The sharptail grouse are about as plentiful as when the reservation was opened. Geese are putting in along the Columbia, on their southern flight.

October was as fine as was ever experienced here. The robins are still here, and the bluebirds have not all left, and the larks are still with us.

LEW WILMOT.

An Amateur Baggage Master.

Editor Forest and Stream:

The editor in the current number, November 7, has something to say about the practice of tipping public servants. His remarks are to the point as far as the tipping of most of them goes, but there is one railroad official who, when he does get a tip, generally earns it, and that is the baggage master. I had a friend who was baggage master on a through train on a road running out of Pittsburgh; and one fall a number of years ago, during the hunting season, having nothing else to do, I put in most of my time riding backward and forward in his car, and collecting the tips that he did not want to earn. These were the only tips that I had ever been given anywhere. I had no business there, but the baggage master wanted me and the railroad officials did not seem to care, so I kept riding backward and forward with him.

The dogs and guns had to be taken care of, and he did not want to do it. On this road no gun, unless it was taken down and carried in a case, could be taken into a passenger coach; but it and the dog were carried free in the baggage car.

I would often have from eight to ten dogs on a trip; these and the guns I put in one end of the car, then staid in that end of it most of the time myself to keep the dogs from getting lonesome. The baggage master said that when he had the dogs they were continually getting up fights, and he had no time to referee dog fights. I never had any to referee. When I saw one about to begin, I would get among the dogs and explain to them that the rules on this road forbade dog fights, and as most of the dogs were of the kind that do what they are told to do, and are not of a fighting strain anyhow, I never had much trouble in keeping the peace. At the end of the

route, after we had got all the baggage dumped out on the platform, I would next bring out the dogs and guns, then each man who had a dog would generally hand me a dollar. I have had them give me two dollars more than once, when they found their dogs and guns in good order, though of course I never would ask anything or try to look as if I expected to be paid. The only part of this money that the baggage master would ever take would be what I paid for our meals at each end of the route when we would get them at a good hotel.

CABIA BLANCO.

Re-Sizing Shotgun Shells.

OSSINING, N. Y., Nov. 7.—*Editor Forest and Stream:* Having been so fortunate as to discover (?) an easy method of resizing shotgun shells that have been once fired with smokeless powder, I hasten to share my good luck with your readers.

The trouble with the work done by re-sizing dies is that by their use the shells become slightly corrugated on the inside and in this climate many will expand within an hour so that they can with difficulty be forced into the breech of the gun. At the best, the operation of a re-sizing die is tedious and laborious.

The swelling of shells is principally due to the absorption of moisture from the atmosphere, and not to the act of firing.

New factory loaded shells, if stored for some time in an ordinary club house without fire, will sometimes swell so that they will not enter the chamber of the gun.

A short time (say 48 hours) before the shells are required for use, place them in a sieve or perforated vessel and let them stand over a stove or hot air register for 24 hours; then load in the usual manner, store in a dry place, and, if possible, use within twenty-four hours. Of course, if they can be stored in a particularly dry atmosphere they may be kept much longer, but in this climate three days will usually be sufficient time to cause some to swell.

Shells treated in this manner enter the chamber freely, but after firing do not extract as readily as those fired for the first time.

Opposed to Preserves.

Editor Forest and Stream:

Not in a decade, a decade and a half or two decades, has anything appeared in relation to sporting matters that has filled me with such blissful feelings as that decision of the Superior Court against the Blooming Grove Park Association of my native State.

Every lover of our democratic institutions ought to rejoice that the concern has been squashed by the heavy hand of justice in such a way that, we hope, it can never reappear. (Here let me say that my authority for using *squashed* is a New Jersey legislator who used *squashed* in one of his harangues, and on finding himself ridiculed in next morning's paper published a correction, stating that he did not use such a word—that the word he used was *squashed*.)

For this digression some inconsiderate readers may think an apology is demanded, but that would be as unreasonable as to demand an apology of the parties who are fighting over Kipling. It is said,

"A little nonsense now and then
Is relished by the wisest men."

"Of which I am one of 'em." I confess that I have been amused by their funny fight, and I hope they may find my little digression equally entertaining.

Kipling is not game, and therefore not legitimate stuff for a sporting publication, but I excuse them.

DIDYMUS.

ST. AUGUSTINE, Fla., Nov. 14.

Pheasant Shooting at Shelburne Farms.

"THE first day's pheasant shooting at Shelburne Farms, Burlington, Vt., resulted in the bagging of over 500 birds. Of course, it was on Doctor Webb's private preserve, and it is no business of ours, but just the same, it seems like a senseless destruction of life."—St. Johnsbury Republican.

Is it a senseless destruction of life to raise turkeys and chickens for home consumption or for market? Doctor Webb raises pheasants to kill for home consumption, and for his friends, just as hundreds of other Vermont farmers raise turkeys and chickens. Instead of slaughtering them in the manner customary here, he invites a half dozen or more ladies and gentlemen friends to spend a week at the farms, and the party goes out to shoot pheasant much as if they would if shooting partridge. And it is no boy's sport, shooting pheasant, as they are swift of wing and fleet of foot; but none are ever shot on the ground. While many of the birds are consumed at the farms, hundreds are sent away to friends in all parts of the country, none being sold. Last fall the party of hunters at Doctor Webb's pheasant shoot included Lady Minot, wife of the Governor-General of Canada, and her daughter.—Barre Telegram.

The Night-Hawk.

Editor Forest and Stream:

I wonder how many of your readers know that New York City—Manhattan Borough—is the home of many kinds of predacious birds? One night in Central Park, near Fifty-ninth street, I saw a good sized owl sitting on a leafless sycamore at the southern edge of the South Meadow near the large mass of rocks. As he slowly winged his solitary flight along, I wondered if he had a mate and family awaiting him in some hollow tree or old gray tower.

Then about July 1 every year at the close of some sultry day you hear high up in the air the first wild sound of the season, the *Pea-ek, pea-ek* of the wild and strange night-hawk, the same cry that greets your ear in the depths of the Adirondacks, in the Maine wilds, and forests of Ontario. It is such a savage, fierce note that you instinctively reach for your favorite old Ballard's, your meat gun, which uses no gold pencils, but a short, stubby reliable .44-40 black powder load, and glance through its brightly grooved barrel. How well

you recall watching a runway in some favorite hunting spot where you have listened to the bird of twilight's note, and awaited the roar that comes after one of his long dives into the lower air, and just as he turns upward in flight. In vain you await the *Go-walk* of the bird in our city. That note he never makes here, and why not? Will someone, another city watcher of this bird, bear me out in this?

It has been supposed by some that the roar was caused by the air rushing into the vacuum made by the swift down shoot of the bird. Others believe that the wing feathers are hollow and that the bird has power to allow air to enter them on its downward flight. The sound always occurs just as the upward rise is made, and must be connected therewith.

From the fact that night-hawks are often seen near large buildings like Carnegie Hall, it might be supposed that they nest there on the flat roofs.

Among the ruins of old Crown Point Fort, on Lake Champlain, opposite Port Henry, these birds often pair and rear their broods. The eggs are laid among the loose stones, and no effort is made to construct a nest.

PETER FLINT.

NEW YORK.

The Biltmore Preserves.

THE lease of the Biltmore estate preserves by E. B. Moore, manager of Kenilworth Inn, is one of the biggest projects considered in this section for a long while. It may be stated that the sum contemplated in the transaction reaches a good way into six figures. Guessers are guessing around \$250,000.

Mr. Moore has returned from a visit of two weeks in the north, where he has been looking into the question of ways and means. Many wealthy sportsmen, members of hunting clubs, etc., have listened with interest to Mr. Moore's outline of his plans, and many assurances of support have been received.

The culmination of the project means the lease by Mr. Moore from Dr. Schenck, as agent for George W. Vanderbilt, of the entire Pisgah preserve, which contains from 120,000 to 150,000 acres. Mr. Vanderbilt has recently added very materially to his holdings in that vicinity. As has been stated in the Gazette-News, there are within the tract more than 100 miles of trout streams, and these streams are well stocked, this alone making the preserve a sportsman's paradise. There is one large hunting lodge, and there are a number of smaller ones. For two years road building has been in progress, and most parts of the tract are now easily accessible. In addition to the fishing, game of all kinds abounds.

Senator Gazzam, of Philadelphia, as well as Mr. Moore, is enthusiastic about the plan. It would be in the nature of a private enterprise of Mr. Moore's, and would bring flocks of wealthy sportsmen to Kenilworth Inn. Asheville would be benefited, directly and indirectly, in many ways; in fact, there is now no additional attraction in this vicinity which could be offered to tourists that would compare with this.

Biltmore estate proper, that is to say, the tract of 10,000 acres in which Biltmore House is situated, is not considered in the deal at all; and persons going to and from the Pisgah grounds will probably not pass through the estate.

In any event the preserve will be kept up by Mr. Vanderbilt and patrolled by game wardens employed by him.

Mr. Moore and Dr. Schenck were in conference at Kenilworth Inn to-day. Mr. Moore stated this afternoon that there was no doubt whatever that the plan would go through.—Asheville Gazette-News.

Big Game in Alaska.

A Tacoma dispatch to the New York Times says: The largest moose ever killed in Alaska was shot last Sunday by Lord Elphinstone and a party in Kenai Peninsula, western Alaska. It was a bull moose weighing 1,576 pounds and measuring seven feet to the top of his shoulders. The skull and horns weighed 75 pounds.

Lord Elphinstone was accompanied by three friends, who left with him for New York yesterday en route for London. The party had great satisfaction in killing the largest moose on record in Alaska, because it meant a victory over Baron Paul Neidick, who headed a party of German sportsmen. Baron Neidick was so anxious to secure his choice of guides ahead of the Englishmen that he paid the steamship Nome City \$1,000 to be landed first at Seldovia, where he could secure the services of the guide, Gilpatrick. He won the race to the North, but Lord Elphinstone's party claims the greater success.

Other moose and many mountain sheep were slain.

New Jersey Game Export.

Editor Forest and Stream:

While I was on my way home last Thursday from a gun club in New Jersey, two friends of mine who had been at the club and who were returning with me, and who had fallen behind me and the rest of the party as we passed through the Central's ferry-house in New Jersey, were stopped by two men, one of whom wore a badge indicating that he was a game warden, and were subjected to annoying questions because they carried their guns with them. Being well bred young gentlemen they answered the questions civilly, and managed to catch the boat on which I was seated wondering what had become of them. The game wardens asked them if they were licensed to shoot in New Jersey, and other questions entirely without warrant because no evidences of game were present. The possession of a gun in a case should not subject a man to a hold up and impudent questioning even by a New Jersey game warden. The explanation that the gentlemen had been shooting in a gun club finally won for them their freedom. They had never visited a gun club before, were guests of mine, and the treatment they thus received very naturally caused me much annoyance.

I desire to suggest that if these game wardens would devote their time to looking after "the song bird shooter of foreign extraction * * * who not only destroys the

but is a bold and defiant trespasser, a destroyer of property and a menace to stock and human life." "who under the trees at daybreak and 'pot-hunts' without who kills simply for their meat the bluebird, the and even the beautiful oriole." instead of exploiting themselves by insultingly stopping gentlemen in a ferry-house and insolently cross-questioning them at the least justification and in the sight of gaping eyes, they would serve much better the interests of the land and of sportsmen.

The Game Laws in Brief.

The standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. The advertising pages list of some of the dealers who handle fish.

Fish and Fishing.

The Ravages of the Atlantic Dogfish.

The attention of the Dominion Parliament was called the other day to the fact that the fisheries of Nova Scotia are threatened with destruction by the Atlantic dogfish. Mr. Kaulbach, one of the representatives of that Province, asked that a bounty of \$100 per ton be offered for the killing of the dogfish. The members from the provinces down by the sea coast advocated the adoption of a similar measure. This destructive fish is largely on the increase at present, and according to the fishermen, the number of salmon, alewives, cod and pollock which it destroys exceeds the total catch of these fish for domestic and commercial use. It is reported that they have been killing during the present year for the first time on the Grand Banks of Newfoundland, and that if they begin fishing that region they will utterly destroy the valuable cod fisheries. Unless a sufficient bounty is speedily offered and proves to be effectual in prosecuting a destructive crusade against the dogfish, it is believed the time is near at hand when the Government will have to fit out an expedition to endeavor to exterminate it.

The publicity attending these complaints has attracted a good deal of attention, and I have been repeatedly asked within the last few weeks as to the identity of the fish complained of. Considering the widely different varieties of fish to which the name "dogfish" has been applied, this is not to be wondered at. This particular fish is not to be confounded with the dogfishes, which have a more southerly range, according to Jordan and Evermann, though it is a member of the same family, to which subclass all the sharks belong. Gunther ranges it with the family Spinaciidae, and gives it the specific name *Acanthias vulgaris*. Jordan and Evermann, following the nomenclature of Linnæus, call it *Plus acanthias*. Storer described it as *Acanthias americanus*. It is commonly known upon various parts of the Atlantic coast of North America as the dogfish, the bonedog, bonedog and skittle dog. Each of its dorsal fins has a spine; that of the first dorsal is about two-fifths the height of the fin, the second dorsal spine being about three-fifths the height of the first. The adult fish is from two to three long, and at a weight of 15 pounds and even more. The body is slender and the snout pointed. Though a comparatively small shark, it is extremely voracious, being very toothed, and having a wide range off the coasts of the Middle and Northern States. It is only in very recent years that it has been known to be so rapidly increasing, and to be so largely extending its range in Canadian waters. It has happened at times in incredible numbers off portions of the British coast, no less than 20,000 having been taken in one season on the English coast. Gunther reports that they do much injury to the fishermen by cutting their lines and carrying off their hooks. It was generally supposed until recently that they fed principally upon herrings, but it is now ascertained that few fish of commercial value are proof against their ravages. They are slate above and pale below, the back marked with whitish spots, somewhat resembling those seen on the sides of the common pike, *Esox lucius*. These spots are most pronounced upon the young fish, but they entirely disappear from the adults, in this respect differing from its near congener, the California dogfish. Dogfish oil is extracted from the livers of several varieties.

A New Brunswick paper recently reported that one of these fish attempted to seize by the leg a boy who was bathing. Notwithstanding the voracious character of these fish, it is scarcely credible that one of them could have attacked even a very small specimen of the Atlantic species, though the monster pike of Lake St. John, not very much larger, after all, than the Atlantic dogfish, has to withstand quite a number of similar attacks.

Destructiveness of Seals.

On an occasion, some weeks ago, writing from a salmon fishing camp on the banks of the Moisie, to speak of the havoc made in the upper part of the river among salmon, by seals. It is not to be supposed that the invasion of the river by seals is any new thing. On the other day that the destructiveness of these animals in the same river was complained of by Professor Hind, who ascended the stream for many miles above the present fishing grounds, in the middle of the last century.

Salmon are not, by any means, the only fish to suffer by the depredations of seals. Repeated accounts are appearing of the enormous destruction wrought by them in Norwegian seas, and of the terror occasioned

among the inhabitants of the northern portion of the country by the huge herds which have come down from the Arctic regions. Off some parts of the coast the sea is said to be literally covered by them. These seals denude the sea of fish wherever they travel, and in some towns and hamlets of Finnmarken, the fishermen have not been able to catch a fish for weeks, the poor being thus caused the greatest distress and misery. The coast in these latitudes has occasionally been infested before with these ravagers among fish, but it has never been previously known that they have migrated so far south as the Lofoten Islands in any great number.

Various suggestions for ridding the sea of these pests are offered, viz., that a premium be given for shooting them, catching them in nets, or killing them by any other means, while others advocate the pouring of petroleum on the sea where they travel, and, lastly, a strong petition is made to the Norwegian Government to send men-of-war to lay explosives out in the sea and frighten the herds away. It is said that the most effectual remedy would be to give all nations permission to shoot the seals at that time of the year when they congregate in vast numbers on the coast of Russia. At present the Russians prohibit seal hunting, except to their own population.

Nothing has yet been done by the Government of Canada for the destruction of the seal life which threatens so seriously the salmon of some of the best rivers, but it is satisfactory to know that some of the owners of the fisheries have themselves offered rewards for the killing off of the animals.

Where Silver Salmon Come From.

The Canadian Indians, who fish the Red River, between Winnipeg and a point some miles above St. Andrews, Manitoba, have had a busy season of it this year, thanks to the growing demand in Minneapolis, St. Paul, and other western cities for "silver salmon." Not many of the consumers of this fish so far away from the scene of its capture, know anything of its antecedents. In Manitoba it is known, and rightly so, as catfish. As the renaming of it by the title of silver salmon adds nothing to either its flavor or the firmness of its flesh, so the fact that the much sought-for "silver salmon" is in reality nothing but a catfish, detracts in no degree from the qualities claimed for it by its admirers as an article of food. Well may we say with Shakespeare:

"What's in a name? That which we call a rose
By any other name would smell as sweet."

Half a hundred camps of Indians are engaged along the Red River during the season fishing for this catfish. The fisherman and his whole family are in the business, for the catfish is the one staple product of the Red River, and the one point about the catching of it which appeals most strongly to the Indian nature, is the ease with which it is accomplished. If it be an art at all it is essentially a contemplative one. It calls for the exercise of neither energy nor skill. Stakes are driven in the bed of the river near to each bank, and between the two is stretched a stout line which rests upon the bottom of the river bed. At intervals of eight or ten feet long the line, smaller ones with stout hooks are attached. When the hooks have all been baited the line has only to be overhauled once a day to secure the fish. The halfbreed or Indian, in his boat or canoe, starts at one end and slowly pulls himself across the river. As the line passes through his hands it is easy for him to see whether or not his bait remains intact, and if a fish is hooked, it is a simple matter to lift it over the gunwale. It is not unusual to take specimens of this fish weighing 50 to 60 pounds when dressed, though the average is smaller. It is by no means extraordinary for one man to make a catch of 700 to 800 pounds of catfish in the twenty-four hours. The fishermen get from 4 to 5 cents a pound for the ugly-looking fish, and the city dealers will buy all they can catch. The dealers ship them nearly all to the United States, for very few are eaten in Winnipeg, notwithstanding that this particular catfish, coming as it does from the cold water of the north, has an excellent flavor, despite its hideous exterior, and the flesh is said to be very nutritious. It can be bought, too, for about half the price in Winnipeg—that is charged for it in the United States, but then, as one of the Winnipeg exporters says, "The American dealer gives the fish another name, and this adds a hundred per cent. to its value." That particular Winnipeg man dissents from Shakespeare's estimate of the value of a name.

More about Prizes for Biggest Fish.

Not long ago there was a notice in this column of a prize competition inaugurated by a Montreal newspaper, which offered rewards for the biggest trout, the biggest doré, and the biggest bass, captured during the season, in the Province of Quebec. The bass which took the prize weighed only 4½ pounds, and was caught by Dr. S. Lachapelle, ex-M. P., at Isle Bizard, near Ste. Anne. The biggest doré, or pike-perch, was a much more worthy representative of his class, having weighed 9 pounds 15 ounces, and measured 2 feet 8 inches in length, and 1 foot 4 inches in the circumference. It was caught by Mr. W. F. McKenzie in the North River at St. Canut. In the competition for the biggest trout, a curious thing happened, illustrative of the prevailing ignorance in many quarters concerning the distinction between the different varieties of the so-called American trouts. The judges of the competition admitted, indiscriminately, to it, specimens of the so-called brook trout of American waters, *Salvelinus fontinalis*, and also of the great gray lake trout or *namaycush*, and awarded the prize to a specimen of the latter variety weighing 22½ pounds. It was taken on a hand line by Mr. Damase Gagnon, of Denholm, in what is known as Little Black Lake, of Denholm. In the published announcement of the award, the extraordinary statement is made that this is probably the biggest trout which has ever been taken on a line in this Province. Of course this statement is absurd on its very face. Not only is it a very well-known fact

that very much bigger trout of the same variety have been taken in this Province, but it is also true that 22½ pounds is by no means an extraordinary weight for one of these big gray trout. Lake St. Joseph, on the line of the Quebec and Lake St. John Railway, and many other waters of the Province of Quebec have yielded larger *namaycush* than the one which received the prize in the recent competition. Of course this fact does not affect the award, but it does show the absurdity of the statement that the prize fish in the trout competition was the largest of its kind taken upon a hand line in the Province of Quebec. The absurdity of the competition lay in the fact that brook trout were accepted in it and weighed against their enormous rival the *namaycush*. Had they been ruled out, as not being strictly within the scientific classification of trout at all, but held to be simply char, it might be easy to comprehend the award. But to pit a beautiful brook trout (*fontinalis*), weighing 9½ pounds, as the judges actually did, against a 22½ pound *namaycush*, in a contest for a prize for the biggest trout, is exactly as if the prize offered for the biggest deer was to be awarded to a very ordinary moose, because it chanced to be heavier than a superb specimen of the magnificent little animal which is popularly known as the common deer. The 9½ pound specimen of the brook trout sent in by Mr. Laliberté, and which was captured some months ago in the big lake, Jacques Cartier, was really a very magnificent and very exceptional specimen of the variety, while the prize winner won with a very ordinary specimen of an entirely different fish. The very best of good faith was doubtless exercised by the judges, but they apparently realized no difference at all in the variety of the different trout sent in or reported in the competition. Most absurd mistakes of a similar nature are constantly being made by confusing the different varieties of the trouts in Canada and the United States. Thus in many portions of the very interior of the country, the *namaycush* already referred to, is known to the common people as "truite saumonée," and, in fact, the prize fish of 22½ pounds was so described, although this name is that which has for a long time past been identified with certain sea-run specimens of the ordinary American brook trout by those who are most accustomed to them.

A Codfish as a Letter Carrier.

A Liverpool young lady named Wilson has in her possession a letter which was cut out of a captured codfish and forwarded to her. Her sweetheart was first mate on board a large sailing vessel, which, on its homeward voyage, encountered terrible weather, and was in imminent danger of going down. Fearing that he would never see land again, the chief mate hastily scribbled a few farewell lines on a scrap of paper, which he addressed to her. The message was then inclosed in a bottle and thrown overboard, but the ship managed to weather the storm and reached port safe and sound. After drifting for some time the bottle must have tempted the appetite of a cod, for it was found in the stomach of one caught off the New England coast, and the contents were at once forwarded to the intended recipient, together with a letter explaining how the letter was found.

Smelt Fishing.

There is an unusual run of smelt at present in the St. Lawrence, and the small boys who can steal a few hours from school or books to fish with rod and line from the wharves on either side of the harbor of Quebec are enjoying the fun of making big scores so far as numbers are concerned, even if none of the contents of their basket are very large. What the smelt lack in size they make up in beauty, however. Some of the young fishermen string as many as a dozen hooks on their smelt lines, and it is by no means unusual to see them haul out three and four fish at a time when the conditions are favorable. The fish seem to take worms, beef, and pork equally well.

There has been very little observation of the habits of the smelt in the St. Lawrence. It is presumed that they spawn here in the spring, as they do elsewhere, but it is rather remarkable that they run up the river both at the commencement and at the end of the winter, and that many of them are found to contain spawn in the autumn as well as in the spring.

E. T. D. CHAMBERS

Susquehanna Bass.

SAYRE, Pa., Nov. 14.—Some of the best fishing of the season has been enjoyed this month on the Susquehanna above Owego. Black bass ranging in weight from 4 pounds to 5½ pounds have been taken almost daily, and the average catch has been large, and the bass of good weight. As a matter of fact, the lovely bit of water reaching out for several miles above the sequestered Southern Tier village has come to be known as one of the finest bass grounds in the Susquehanna, barring, of course, Wyalusing, and the big bass are usually taken during late October and November. Should the weather continue during the month as calm and sunshiny as at present, the bass fishing may be expected to remain at its best. A good many large pike—8 and 9-pound fellows—are also being taken from the waters above mentioned.

M. CHILL.

Mr. Brackett's Salmon Record.

LET it be recorded that Walter M. Brackett, the fish painter, who is eighty years of age at the present time, caught 72 salmon in his six weeks' outing on the river St. Marguerite last summer. He has seldom missed a season on this Canadian stream for a third of a century. To handle and land so many big fish shows a remarkably vigorous old age. Walter's brother, E. A. Brackett, of Winchester, Mass., is 85.

All communications for Forest and Stream must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

On the Stream.

Editor Forest and Stream:

As I read FOREST AND STREAM from the outside of the first page to the last line on the back cover, almost, the articles on Kipling's "Red Gods" did not escape me, and I am "moved to remark."

I have read many of Kipling's writings diligently and carefully, as some of my friends thought them to be of much worth; but disappointment has been mine in almost every case; as, to me, there was nothing grand, inspiring or even pleasing, where I had been led to expect much.

I am moderately of Mr. Brown's opinion in regard to the lines he criticises. To me there is nothing pleasing in a landscape where burnt timber is the most prominent feature, while "raw right-angled" doesn't fitly describe any log-jam I ever met. (I hauled around and over several this summer.)

A "bar of sun-warmed shingle" isn't so bad as calling a big-mouthed bass a trout, as is done in the south. I would rather repose on a grassy bank in the shade of even a burned tree, in the majority of cases, at the time of the year that I go trout fishing. It's a softer seat and more conducive to dreams.

"Shod canoe poles" I pass, as I never heard one, and my experience was all confined to ten hours of one day.

There were four of us, my brother, J. A., his companion, the professor; "Old Ike," his last name is Watson, and no mean fisherman, either, and myself, cruising in two sailing canoes bound for Lake Superior; but when we got to the mouth of the St. Mary's River, "The wind it hauled ahead, so we kept her full and by and laid her to the wind just as close as she would lie" (I heard two sailors sing that over twenty years ago), bringing up at the mouth of the Massassauga River about sixty miles east of Detour.

Here we heard from some lumbermen who had just come down with the drive, of a lake "up country" that was full of large trout. One man had caught a grain sack full on a Sunday.

A council of war was immediately called in the store near by of the H. B. F. Co., whose agent became ours till the professor had bought a birch bark canoe (price \$6) and hired an Indian; Old Ike had hired an Indian and canoe, while J. A. and I declared that where one Indian could paddle his craft two white men could follow, the agent letting us have his own canoe.

We paddled and portaged and then paddled some more, till one morning the "silent smoky Indians" (they laughed, shouted and sang, and were very jolly after getting acquainted) appeared with four cedar poles.

"Hello, Dave," called Watson to his Indian, "what are those for?"

"Lots of rapids to-day, got to pole."

"How far do we get to-day?"

"Mebbe ten mile."

This was new work to J. A. and me; but we allowed that where one S. S. I. could pole, two white men could. However, we were careful to be the last to embark.

"Racing stream" is good. No other word so perfectly describes what we negotiated that day; but it needed occasionally the adjective "roaring," where a slip of the pole meant a smashed canoe if not worse; and the poles could not have been heard to click had they been big as top-masts and shod with cannon balls.

Of course our poles were not shod, and were thrown overboard the minute we got through with them. I believe, though, that a shod pole could be heard some little distance under some conditions, as I know that a pile pole striking stones gives out a sharp sound, which, however, I am certain would be absolutely drowned by a racing stream combined with a log-jam if they were in the near vicinity.

Kipling's "log-jam at the end" may have been any distance from the "bar."

Hemlock, fir, spruce, and even cedar may be, and are, all right if you have someone to pull them for you. We used to cut them when we were young and romantic; later we just spread our blankets and slept, never more soundly.

When I am reading FOREST AND STREAM I am often tempted to seize my pen and walk on the writer of some article. For instance, birch bark canoes as built by the Indians, as described in the issue of October 10 under the title of "Canadian Indians Built First Canoes."

I'll just quote a little: "Eighteen feet long and more than four feet wide," "weighs about fifty pounds!" "The white man has never improved much on the fashion of canoe building set by the red man." "A canoe built at Sunnyside is stronger than a bark canoe at the expense of being twice as heavy."

As well say that my split bamboo rod, automatic reel, silk line, gut leader, and flies at \$1 to \$1.50 a dozen were not an improvement on the Indian's cedar pole and bone hook.

I feel that I am becoming irritated and may be tempted to say that it is bad enough to read such things in the Brooklyn Eagle, but worse to see them copied in FOREST AND STREAM, especially in the canoeing department, and can only account for it by supposing that the canoeing editor is where I wish I could be—in a canoe off hunting.

"Well, well," as the old Quakeress said to her husband, "all the world is queer but thee and me, dear; and sometimes even thee is a little queer."

V. E. M.

TRAVERSE CITY, Mich.

A Big Muscalunge.

THERESA, N. Y., Nov. 11.—Dr. J. E. Kelsey, of this place, has just reported to me that a muscalunge weighing 52 pounds was caught in Muscalunge Lake yesterday by a Mr. Brown, who resides at the head of that lake, which is about three-quarters of a mile from the foot of Red Lake, where I have spent two months of my vacation this season. J. L. DAVISON.

The Maryland Field Trials.

CHESAPEAKE BEACH, Md., Nov. 9.—This picturesque place, which was destined to outrival Monte Carlo, was the scene of the first annual and successful field trials of the Maryland and District of Columbia Association. It is beautifully situated on the western shore overlooking the Chesapeake Bay, with its glistening sandy forlorn race track, countless outbuildings of stables, casinos, and boardwalks that recall the palmy days of Coney Island (but without the crowd). An ideal hotel and club house with modern conveniences, all bespeaking an outlay of thousands of dollars, the grim shadows of which mean money lost in an investment that died an unnatural death. Arrangements had been made for a special train connection with Washington and Baltimore at Hyattsville, and it was a happy and jolly crowd that met with the best dogs that this section could produce.

The hunting ground covered 3,500 acres, through a section of rough hills and swamps that proved poor ground for field trials. Owing to lack of cultivation the fields were overgrown with dense sedge grass and weeds, which impressed the members that birds can only be found in numbers where food can be had.

Monday, the first day, was an ideal one as to weather. The Derby for dogs whelped in 1902 was the only event decided, owing to the late arrival of the train. Promptly at noon the judge, Mr. Royal Robinson, of Washington, announced that the start would be made.

Only four dogs were entered, and it took until dark to adjudge the winner. The entries were Rappahannock, owned by R. E. Seeger; Count, owned by George Dobbin Penniman, and Lady Lou, owned by Grayson H. Gent, of Baltimore, and Bird West, owned by Mr. J. L. McCormick, Trappe, Md.

First—Count, a setter by Scamp, out of Polly. Count is owned by Mr. George Dobbin Penniman.

Second—Bird West, a setter bitch, by Pennington's Dash, out of Bird Wise, by Document, owned by Dr. J. L. McCormick, of Trappe, Md.

Third—Lady Lou, a pretty little setter gip, owned by Grayson H. Gent.

Fourth—Rappahannock, a pointer, by Billdad, out of Sappho, owned by R. E. Seeger.

The first brace was put down at 1:10 Monday, within half a mile of club house.

Count, a setter by Scamp, and Rappahannock, a pointer by Billdad. The pointer being in bad form was outclassed; yet both dogs showed well, the setter more in ranging. After an hour and forty minutes neither dog had pointed. Birds were flushed in the swamp but the judge could not see the dogs.

The crowd following the handlers was ordered to go slower, and nearly all being new men at field trials it was not reasonable to expect that the trials would be run without some breaks.

The second brace was started immediately after the judge ordered the first dogs to be taken up. They were more successful, running into a covey of ten birds ten minutes after the start. The dogs were Lady Lou and Bird West. Bird West scented the covey, and, while circling them, Lady Lou came up and found them. Bird West went to a point, and Lady Lou immediately back stood, the pair making a beautiful picture. They were held that way for about a minute, when their handlers shot over the birds.

The judge could not decide the winner, because both were perfect, and the search was continued. Bird West pointed two more single birds, while Lady Lou was unsuccessful, thus giving Bird West the victory. The final trial, between Bird West and Count, only lasted about a half hour, Count getting the prize through his individuality. The day's sport ended with the deciding for the third and fourth prizes between Rappahannock and Lady Lou, the latter getting the third prize. Rappahannock was sick and in poor form, this being the excuse for him not doing better. The north and northwestern section of the beach were the directions selected for today's trials, and it was learned afterward that the birds were more plentiful to the south. Judge Robinson said after the trials, considering the briers and brush encountered, all of the dogs did fairly well. About twenty-five people, mostly from Baltimore, followed the dogs, and when the visitors returned to the hotel they were glad to take a rest. Those who came down in the Baltimore party were: T. C. Dodge and W. L. Kidwell, of Washington; G. H. Gent, William R. Armstrong, Dr. H. P. Hill, John T. Higgins, T. W. Lloyd, F. C. Arthur, Henry W. Walker, George Dobbin Penniman, McDonald R. Kemp, and George P. Mordecai, of Baltimore; J. L. McCormick, of Trappe, Md.; Roland T. Seeger, Joseph A. Abbott, of Baltimore.

Tuesday was a beautiful morning, but the scenting conditions were poor, the day being warm, the earth dry and dusty. Such conditions were rather discouraging, yet an enthusiastic crowd followed the trials, which were begun promptly at 8:30 o'clock. Rox, an English setter, the property of Mr. G. L. Nicholson, of Washington, and Mr. Philip T. Hall's pointer Roy were the dogs selected to go on the first brace. From the call of the judge until they were ordered in, the dogs worked in a most diligent manner. Both showed much independence and ranged very widely. At the end of forty-five minutes, during which time neither dog managed to get a point, the judge called the pair in.

The pair drawn for the second brace were Dr. J. L. McCormick's Mack Ewing and W. R. Armstrong's Dan of Woodcliff. After working twenty-five minutes Mack

Ewing came upon a scent and he pointed beautifully. He flushed at the order of the judge, and it was seen that he had sent up a woodcock. Dr. McCormick brought down the bird in fine style. The work of Dr. McCormick's animal was excellent throughout. During the next twenty-five minutes neither dog came upon anything and they were called in.

The pair of the third brace was Dr. McCormick's handsome setter Jim Thompson and T. C. Dodge's Count Rex of Heathcote. The dogs worked well, but there was "nothin' doin'" in the way of birds, and during the three-quarter-hour hunt neither animal scared up a single bird.

The party had by this time traversed a distance of five miles to the northeast of the city. Lunch was taken, and at 12:30 the trials were again resumed. The pair selected were again resumed. The pair selected for this turn was T. Conrad Dodge's Flash of Heathcote and Dr. H. P. Hill's pointer Dan C. The dogs had been out only short time when two coveys were flushed.

The next pair to go out and try conclusions was Mr. Martin McCormick's English setter Tramp and Mr. Sylvester D. Judd's Mallwyd Prince. They did excellent work, and were followed by the pair that ran the last brace. They were Mr. Sylvester D. Judd's Florence Price and Dr. B. Holly Smith's pointer Nero.

A meeting of the board of governors took place last night, after which the annual meeting of the association was held. The following officers were elected: George D. Penniman, of Baltimore, President; T. Conrad Dodge of Washington, Vice-President; William R. Armstrong of Baltimore, Secretary-Treasurer. The above, with the following, constitute the Board of Governors: Philip T. Hall, of Washington; J. Alden Houston, George P. Mordecai, Franklin Upshur, B. F. Westcott, Grayson H. Gent, of Baltimore; Royal Robinson and H. L. Nicholson, of Washington, and Dr. J. L. McCormick, of Trappe, Maryland.

The grounds are probably as good as can be found in Maryland, and with the sowing of grain food would undoubtedly make an ideal field trial grounds. The worst feature is the swamp and thicket where the single bird work is done. Mr. Royal Robinson, the judge, was very liberal and painstaking, and gave his entire attention gratis. President George Dobbin Penniman, who bears a striking resemblance to President Roosevelt, was a conspicuous figure during the trials. The success of the meet in a great measure is due to efficient work of Mr. T. Conrad Dodge and Judge Robinson, of Washington, D. C., who arranged for the grounds and accommodations of the members and visitors.

JNO. T. HIGGINS.

A Case of Adoption.

SEYMOUR, Texas.—The quail are very plentiful in our part of the country this fall, and there being plenty of cover they lie well. While out last Tuesday with my pointer Bob, I had rather a novel experience. Bob is usually very steady, and seldom makes a false point. We had found several coveys of birds, so when the dog began to road along the creek we were on I got ready for another bunch. As he approached the creek bank he pointed, drew, and pointed again, finally coming to a full stop and straightening out. I had moved up almost to him when the worst scared coyote I ever saw got out of the creek bottom and left the country as if he had a lighted bomb attached to his tail. Bob appeared to be nearly as dumbfounded as I was. He was somewhat crestfallen, and quite doubtful of that creek while we were on it.

A few days ago one of my foxhound bitches whelped shortly afterward she lay on three of her puppies, which were removed. But the bitch seemed exceptionally nervous about their loss, counting the remainder over and over, and finally getting for them around the kennel. She did this a number of times, but finally seemed satisfied they were gone for good.

The next afternoon a Scotch deerhound bitch whelped and at the first sound from the pups the foxhound, Queen, became half crazy, and made several efforts to get to them through the kennel partition. I stayed with the deerhound till supper, when I was obliged to leave for about fifteen minutes. I left the one puppy which had come rolled up in a blanket for fear of its being crushed during my absence. On coming back the pup had gone—where I could not imagine till I found that Queen had somehow got to it, and, taking it from within the blanket, conveyed it to her own apartments, where it was curled up with her pups apparently perfectly satisfied.

[Bob's point was an odd one, but we think not unexampled. We have heard of quail dogs pointing deer that lay close, and it is a common experience to see dogs point a cat, a skunk, a turtle, a snake, or a hen. In many of these cases the dog unquestionably meets with a scent which he does not recognize, and stops, endeavoring to locate the object emitting the odor and to discover what it is. This, we presume, was the case with Bob. I traveling over the ground which he hunts, the dog must meet with many odors, some so familiar as to be at once recognized, others totally strange to him. We know a little about the sense of smell in the "lower animals," and about the sensations conveyed to the brain through the olfactory nerves, that almost all theorizing on this subject must be based on conjecture.]

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

All communications for Forest and Stream must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Yachting.

THE second cruising competition given by this paper on Nov. 15. Our first attempt in this direction was a great success, and we were therefore prompted to give another, but the reception accorded the second exceeded our most sanguine expectations. There were over three times the number of stories submitted in the second than in the first, and the standard of the prizes was much higher. In nearly every instance the conditions governing the completion were adhered to, and the stories dealt with cruises made on nearly all the navigable waters in the United States' possessions; one of the stories treated of a trip around a remote island of Honolulu.

When we organized these cruising and designing competitions we hoped they would prove of practical and lasting value, and that the publication of the prizes and designs would be of universal interest.

Mr. Theodore Zeraga has again agreed to act as judge, and make the awards. Mr. Zeraga judged the prizes in last year's competition with great care and excellent judgment.

We are confident we have accomplished all we planned, and from now on we propose making these competitions a feature of this department.

We will soon make public the conditions for another designing competition. The prizes will be larger than those given, and the design will be for a centerboard sloop or yawl of about 40ft. waterline. This is a considerably larger craft than has been attempted in any of our competitions, but it is a very popular size, and a boat of that length enables one to secure sufficient accommodation so that two or three men can make their home on board for a period of several months and have many of the comforts and conveniences that would be impossible on a smaller craft.

The old 40ft. class was in many ways one of the best in this country ever saw. Much good racing was had between these boats, and many of them are still being used as cruisers. The nearest approach to this class in the modern boat are the 43-footers on Long Island Sound. They have been accepted as being most successful for racing and cruising. Take for instance Mira, Fort, Challenge, Mimosa II. and Aspirant, all these boats have been raced hard and have afforded their owners fine sport. Nevertheless, every one of them has ample room below for quarters that are roomy and comfortable. Another splendid craft of about this size is Irondequoit, the winner of the Canada's cup last summer. She is very fast and able, and has a vast amount of room below. Such a vessel with a snug cabin would make an admirable cruiser, and could be handled with two or not more than three paid hands. A boat of that size and type has a wide cruising range, and her field of usefulness is great. This is the kind of boat we had in mind, and there are many men of moderate means who are looking for just such a boat. We believe that this competition will meet with the success and approval that it deserves.

The possibility of a universal measurement rule appears so remote that many of the enthusiasts have finally abandoned the plan, believing it to be hopeless. The rules that have been tried thus far, both on this side of the water as well as abroad, have met with very different success, and to-day the situation is worse than it has ever been before. Four rules of measurement are now in force among the clubs, and the association on Long Island Sound, and yachtsmen, after finding what the situation was, neither built new boats nor raced their old ones.

Restricted and one-design classes seemed to be the only solution of the problem, and new restricted classes are being formulated by the Massachusetts Y. R. A. and the Y. R. A. of Long Island Sound. We are strongly opposed to one-design classes in particular in restricted classes in general, but still such racing is better than none at all, and we console ourselves with this thought.

In this issue of FOREST AND STREAM there appears an able article on the measurement question by Charles Lane Poor, owner of the 43-footer Mira. We wish to call special attention to Mr. Poor's article, as it advances several new theories, all of which seem good. His comments on time allowance appear very sound and practical. We trust that this paper may rekindle interest in this question that is of such vital importance and be the means of bringing about some beneficial results. When the racing dies down the life of yachting is killed, and the present situation is a sad one, and it is undermining the very foundation of the sport.

Notes on the Measurement of Racing Yachts.

BY CHARLES LANE POOR, PH.D.

DURING the last quarter of a century great advances have been made in the designing and building of yachts. "Rule-of-thumb" methods have been discarded, and the modern racing yacht is the result of deep study and elaborate calculations as to weight and strength of material. Yet with all this advance in designing and building, no commensurate advance has been made in the principles of classifying and rating such yachts for racing purposes. The rules of measurement under which yachts are to-day are constructed upon "rule-of-thumb" methods. According to racing yachtsmen and designers the rules thus constructed are all unsatisfactory, and are produced, and are producing, bad types of yachts. No consistent attempt has been made by any club to apply the scientific principles involved in the problem.

Having in mind the importance of the subject, both from a scientific and a sporting point of view, the writer, in the following notes, has attempted to bring clearly before all yachtsmen the fact that the present rules of measurement are founded upon certain assumptions as to the speed of yachts; to show that such assumptions are not clearly warranted by the data at their command; and to indicate the principles on which the

measurement and classification of yachts should be based.

Time Allowance and Classification.

The table of time allowance is the most important element in the problem. Except in one-design classes, all systems of classification and handicapping rest on the time allowance table. In many of the larger events each year boats of widely different sizes race together, and the prize is won or lost by the aid of time allowance. The table of allowances which is in common use in all clubs was first adopted in 1883. At that time length was recognized as the prime factor in producing speed, and the tables were based on the rule generally accepted by naval architects, that "within economic limits, opportunities for speed vary in different vessels as the square roots of their respective lengths." This simply means that under normal conditions a boat 100 feet long should sail at the rate of ten miles per hour, ten being the square root of one hundred, and that a boat 36 feet long should, under the same conditions, sail at the rate of six miles per hour, six being the square root of thirty-six. The larger boat should thus sail one mile in one-tenth of an hour, or six minutes; the smaller boat in one-sixth of an hour, or ten minutes, and hence the larger boat allows the smaller the difference between these times, or four minutes per mile. Computing thus the times for boats of all different sizes, a complete table of allowances is formed, which is thus nothing more than a table of inverse square roots. As in practice it was found that this allowance was too large for ordinary summer racing, eight-tenths only of the allowance is actually given, and the table, as found in the New York Y. C. book, gives eight-tenths of the full allowance. That is, the thirty-six foot boat receives only 3.2 minutes per mile instead of the full 4 minutes. These figures can be verified by comparison with the tables in the New York Y. C. book, from which we find the allowance in this case would be 192 seconds, which is the same as 3.2 minutes.

It was at once seen, however, that length is not the only factor in producing speed. Motive power is certainly a factor, and in a sailing yacht motive power is furnished by the sails, and the amount of such motive power varies with the sail area. In order to take account of this speed producing factor, in computing the time allowance from the above rule, the fiction of a "racing length" was introduced—the length in the rule being replaced by the "racing length." Such "racing length" was, and is, determined from measurements of hull, spars, and rigging, and does not bear any direct relation to the simple length of hull. Sail area was thus introduced and appears in all rating formulae; and in the latest rule—the New York Y. C. rule adopted this year—a third factor—displacement—is brought in. The two principal rating formulae are the old New York and the new New York as given below:

$$R.L. = \frac{1 + \sqrt{S.A.}}{2} \quad (1).$$

$$R.L. = 1.5 \frac{1 + \sqrt{S.A.}}{\sqrt{D}} \quad (2).$$

The Larchmont rule and the rule adopted by the Yacht Racing Association of Long Island Sound are but modifications of (1), the principal factors being the same and introduced in the same way.

We have already seen that all methods, so far adopted, for computing time allowance assume that speed is proportional to the square root of racing length. Now, an examination of the above old and new New York rules shows that for either rule, so far as sail area affects racing length at all, that effect is proportional to square root of sail area. If, then, as we have seen, the time allowance table always makes speed proportional to square root of racing length, then, so far as sail area can affect speed, according to either New York rule, that effect must be proportional to the square root of the square root of sail area, which is the fourth root of sail area. In other words, if the time allowance tables and either of the New York rules are correct, then the speed of a yacht must vary according to the fourth root of sail area. We shall see further on that such is not the case in actual sailing.

In view of the above considerations, we see the adoption of the measurement rule (1) involves the assumptions that speed is proportional to

- the square root of length of hull,
- the fourth root of sail area,

and that the new New York rule (2) involves these two assumptions, and the additional one that speed is proportional to

- the inverse sixth root of displacement.

On what basis do these assumptions rest; why use the sixth root of displacement, instead of the fourth root, or the tenth root? The printed report of the committee throws no light on this subject. The only imaginable reason for the introduction of these factors in this way seems to lie in the supposed necessity for reducing every factor in the rating formula to the dimension of "length." There may be other and good reasons, but if so they are not made apparent in the reports of various committees. In fact, the report of the committee in 1883 regarding the original rule seems to indicate plainly that this was the sole reason for thus introducing sail area. The square root of an area is a length, and in 1883 such square root was somewhere near the length of the yacht itself, and as a length could be readily added to a length, the square root of sail area was adopted in the rating formula. The cube root of displacement is a length, so cube root of displacement is used in the formula. There is no valid reason why the rating formula should contain nothing but length factors, and a brief review will show upon what weak foundations the various measurement rules and table of allowances rest.

- Assumption as to length.

The assumption, in all rules, that speed is proportional to the square root of length of hull seems to be fairly well justified. The fact that the longer hull can be driven faster by the same power has been demonstrated time and again, but the exact relation between length and speed is not so easy to deduce. Naval architects hold, as result of experience, that for moderate speeds, and within certain limits, opportunities for speed in boats of similar

design vary as the square roots of their respective lengths. This relationship holds fairly well for speeds up to twelve miles per hour, a speed far in excess of the average speed of even the largest yacht during races.

Thus tests and the experience of naval architects seem to show that this assumption is not radically wrong, and that it represents the truth fairly well; sufficiently close, at least, for the purposes of yacht measurement. Simple waterline length is, however, no longer a proper measure of length in the modern yacht with its excessively long and full overhangs. The waterline length does not represent the actual length of the boat, when heeled over, and a modification of waterline should be used in the formula. Such modifications have been introduced, as in the Larchmont rule and the New York rules.

- Assumption as to displacement.

The relationship between speed and displacement is extremely complicated, and there appear to be no data at hand by which this assumption can be tested. As a result of one season's racing, it seems to be established that the present rule gives too much advantage to displacement; in other words, the present rule uses displacement wrongly. Tests and experiments alone can show how this factor should be introduced into the rule, and what the real relationship between speed and displacement is.

- Assumption as to sail area.

The assumption in all measurement rules that speed is proportional to the fourth root of sail area does not seem to be founded on any substantial basis. In fact, all investigations and tests seem to show that this assumption is radically wrong; speed seems to be more nearly proportional to the square root of sail area. To test this point we have elaborate experiments upon the power necessary to drive boats at different speeds. Probably the best and most satisfactory tests are those of Froude, whose investigations are of the highest order of merit. The result of such tests is that for moderate speeds (up to twelve knots) the power necessary to drive a hull through water is very nearly proportional to the square of the speed. That is, if engines of a certain size can drive a hull four miles per hour, it will take engines of four times the power to drive the same hull eight miles per hour. In a steamer the power is developed by the engines, in a sailing vessel by the sails, and the power developed by the sails is proportional to the area of the sails themselves. As few yachts ever sail a race, or portion of a race, faster than twelve miles per hour, these tests show that in actual practice power, which is proportional to sail area, varies as the square of the speed. In other words, they show that speed varies as the square root of sail area, and not as the fourth root, as assumed by all rules now in force. Therefore, as long as the present tables of time allowance are used, the RL should contain the factor SA, and not the factor VSA, as at present.

We thus see that, under all rules in force since 1883, sail area, or power, has not been taxed sufficiently: boats with greater sail area have not given their due amount of allowance. This fact developed early, and the rule adopted in 1883 was modified by changing the coefficient of VSA. While this increased the tax on sail, it did not increase it enough, nor did it increase it in the right proportions. Naturally designers have developed that factor which is not duly taxed, and hence we have had boats with constantly increasing sail area. The sail area carried by a cup defender has doubled during this period.

I have made the following attempt to test the correctness of the assumption contained in all rules that speed is proportional to the fourth root of sail area, by comparing the races of two yachts during the years 1902 and 1903. These yachts sailed many races over the same course during each year, and I here specify them as M and E respectively. During both of these years yacht E was in the same condition and sailed by the same crew. In the spring of 1903 yacht M had her sail greatly reduced, but was otherwise in the same condition as in 1902, and was sailed by the same crew, amateurs and professionals, during the two seasons. Therefore the only difference in the condition of races was the decreased sail area of M, and the results of these races should throw some light, therefore, on the value of sail area as a factor to speed. Unfortunately for an exact comparison, the strength of the breeze was much weaker in 1903, it taking the yachts on an average much longer time to cover this same course than it did in 1902. The following tables give the results of three races held in 1902 and four races in 1903, all seven races having taken place over the same course, and as near as possible under the same conditions. In each season one or more races are omitted from the series, as they were mere drifting matches, having taken over five hours to cover the course.

RACES—1902.			
Time of Race.		E wins by	
Hours.	Minutes.	Minutes.	Seconds.
3	11	12	46
2	48	2	40
3	25	4	20
<hr/>	<hr/>	<hr/>	<hr/>
Av. 3	8	6	35
Average Speed—			
M		7.18 miles per hour	
E		7.44 miles per hour	
<hr/>		<hr/>	
		.26 miles per hour difference	

RACES—1903.			
Hours. Minutes.		Minutes. Seconds.	
4	1	39	1
3	43	17	11
4	5	12	2
4	14	18	19
—	—	—	—
Av. 4	1	21	38
Average Speed—			
M		5.62 miles per hour	
E		6.17 miles per hour	
		<u> </u>	
		.55 miles per hour difference	

In the first series E averaged .26 miles per hour faster than M; in the second series, .55 miles per hour faster. The difference between these two figures, or .29 miles per hour may, I believe, be called the decrease in speed in M due to the decrease in sail area. This, of course, assumes that E could be used as a standard of speed, and sailed as fast, and no faster, in 1903 as she did in 1902. The average speed of M during the whole series was 6.4 miles per hour. The waterline length of M was 36 feet, over all length, or length on deck, 54 feet, and the actual waterline length when heeled over by a breeze would not be far from 42 feet, which would give a theoretical speed ($S=\sqrt{L}$) of 6.48 miles per hour.

We have the following approximate data for M during the two seasons:

	$\sqrt{S.A.}$	$\sqrt{S.A.}$
1902	50	7.08
1903	48	6.94

From this we see that if speed is proportional to the square root of sail area, the speed of M should have decreased 4 per cent. in 1903 from that of 1902, but if speed is proportional to the fourth root of sail area, it should have decreased in 1903 by 1.98 per cent. Collecting these results in the form of a table we have the following:

Average speed.....	6.50 miles per hour
Decrease per Larchmont Rule, $\sqrt[4]{S.A.}$09 miles per hour
Decrease if proportional to $\sqrt{S.A.}$26 miles per hour
Observed decrease29 miles per hour

This shows that the observed decrease of .29 miles per hour was larger even than the decrease on the assumption that speed is proportional to the square root of the sail area, which calls for .26 miles per hour decrease, but these two figures are in extremely close accord for such a rough calculation. It shows certainly that speed is much more nearly proportional to the square root of sail area than to the fourth root of the sail area, which is the factor now used in all rules both here and abroad.

While, of course, this one case is by no means conclusive evidence, yet taken in conjunction with the experiments of Froude, it tends to show that in all rules of measurement sail area should be so introduced as to make speed proportional to the square root and not to the fourth root.

Conclusion.

If the results, indicated in the above notes, should, upon further investigation, prove to be correct, then the present rules are all based upon a wrong assumption, and no amount of doctoring will correct them. These rules assume that, in order to halve the speed of a hull, the sail area must be decreased to one-sixteenth of the original amount, while the tests referred to and the results of experiments in actual racing would indicate that the speed would be halved if the sail area be decreased to one-fourth the original amount. Which of these is more nearly correct, one-sixteenth or one-fourth? In 1902 the average speed of M, a 43-footer, carrying 2,500 square feet of sail, was 7.18 miles per hour. Does it seem possible that this yacht could have sailed the same course, under the same conditions of wind, at the rate of 3.59 miles per hour if she had carried only 156 square feet of sail—less than that contained in a storm topsail? Yet this is what the measurement rules would force us to believe.

A few careful experiments would decide the question, and such experiments could be conducted in a tank, or preferably in actual racing. A very conclusive test of the relationship between speed and sail area could be made with three or four of the Newport thirties. These boats have raced together for years, and their relative speeds are well known. Increase the rig of one, decrease that of another, leave the third and fourth unchanged, and then race the four boats over different courses, in light winds and in heavy winds. Ten or a dozen such races would furnish reliable data, such as would appeal to yachtsmen as no tests in tanks would or could.

Why should not the assumptions in the measurement rules be made the subject of scientific investigation? The problem is worth the attention of the best mathematician or physicist, and the results of such an investigation would enable practical yachtsmen to formulate a rule of measurement that would, at least, be founded on correct principles.

Two Houseboat Designs.

Messrs. Sadler, Perkins & Field have just completed the design for a twin screw, shallow draft houseboat, designs for which are published herewith, now building at the yard of the Nilson Yacht Building Co., for Mr. A. R. Whitney, of Morristown, N. J. The vessel is 96ft. over all, 91ft. waterline, 20ft. beam, with a guaranteed draft of 2ft. 6in. She is propelled by twin screw gasoline engines of 60 horse-power each.

Just after the forecabin deck is a large double state room for the owner, extending the entire width of the boat, with a private bath opening into it from the port side, following which are four state rooms with two berths each to accommodate the owner's family and guests. There is also an extra toilet provided on the starboard side just aft of state room No. 5. Each state-room is provided with a large wardrobe, and in three of the four wash basins are also installed. Aft of the owner's sleeping quarters come the engine room, mess room, galley and pantry, and a broad passage connects the forward quarters with the main saloon, which comes directly aft of the engine room, extending the width of the vessel. As the vessel is intended for Southern cruising, ample provision for cold storage, and a large supply of ice has been made, the main ice box extending from the hold to the upper deck, being 5 by 5ft., and double entrance being provided to both pantry and galley. Aft of the main saloon come the crew's quarters, provision being made for captain, two engineers, steward and cook, while two deckhands are berthed in swinging pipe berths in the mess room.

Just forward of the engine room is the main companion leading to a large deckhouse on the upper deck, to be fitted as a library and general lounging room. A low casing for ventilating purposes is built over the engine and mess rooms, aft of which the upper deck has been kept clear as possible and affords an excel-

lent promenade for the owner and his guests. Three boats are carried on davits stepped on the outside of the rail, namely, an 18ft. launch, 16ft. gig and a 14ft. skiff. Just aft of the deckhouse is a shelter seat, while forward an observation seat for use in pleasant weather is provided.

A special feature of this vessel is the watertight door cut in the starboard side of the boat to lead directly into the main vestibule opposite the main companion, to be used by the owner in pleasant weather, making an easy entrance through the side of the vessel from the small boats, while in rough or stormy weather the companion ladder leading directly to the upper deck will be used, while the watertight door is battened down.

All state rooms, main saloon and deckhouse are connected with pantry by call bells and telephone, and electric light plant in engine room supplies vessel with interior and exterior lights.

As mentioned above, the vessel is to be used in Southern waters, particular attention having been paid to the ventilation on this account.

The accompanying plans show the general arrangement and outboard of a three-deck outside cruising houseboat, also designed by Messrs. Sadler, Perkins & Field, for a well-known yachtsman in Connecticut. The dimensions are l. o. a., 108ft. 6in.; l. w. l., 102ft.; beam, 23ft. 3in.; draft, 6ft., with a speed of 10 knots per hour.

The particular feature of this boat is the fact that the owner has the entire main and upper decks to himself, the crew being berthed on the lower deck. The advantages of the privacy thus afforded to the owner and his guests will be readily appreciated, and form one of the boat's most attractive features. As customary in all their houseboats, the designers have carried the deck house all the way forward to the bow, giving the additional space thus obtained to the owner, and saving what is usually the forward deck space in houseboats of the old design. The owner's quarters come forward on the berth deck, consisting, as will be seen, of an owner's bath and large double state room extending the entire width of the vessel, followed by two children's rooms, maid's room, and another bath room. The vestibule, opening from which comes the main opening to the deckhouse, has been utilized as a library, while the passage connecting the owner's quarters forward and aft has been developed into a very attractive reception room. The main saloon goes aft of the engine and boiler space, while two guest's rooms and bath come at the extreme after end of the house.

The pantry, galley and mess room are worked into port of the engine and boiler casing, and crew's companion leads from the mess room to the berth deck, where provision is made for a captain, chief engineer, steward, cook and four seamen, while, besides, is a large crew's bath room, laundry, drying room, trunk room and store rooms. The engine and boiler space is also entered from this deck, keeping, as above stated, the berth deck absolutely for the owner's use. On the upper deck the deck house is fitted up with gun rack, chart table, lockers, etc., and is to be used as a sitting and observation room by the owner.

Three boats will be carried, launch, cutter and dinghy, while the vessel will be lighted throughout by electricity, and the various owner's quarters connected with pantry and steward's room by the usual call bells and telephone system.

The machinery consists of an inverted triple expansion condensing engine, taking steam from an Almy water tube boiler, while ample coal bunker space provides for a large cruising radius.

At the October meeting of the Corinthian Y. C., of California, a committee was appointed to form a syndicate to build a boat to defend the Sir Thomas Lipton Racing Cup. The syndicate will be formed of local people and stock will be open to subscription. The boat will cost \$5,000.

Secretary Lancaster was instructed to write Lipton asking permission to use the 30ft. cabin cruisers instead of the 30ft. racing machine specified by him, also that the course may be changed to the regular club course on account of more favorable winds.

HOUSE-BOAT—DESIGNED BY SADLER, PERKINS & FIELD FOR A. R. WHITNEY.

The Auxiliary Schooner Atlantic.

THE three-masted auxiliary schooner Atlantic was launched from the yard of the Townsen Downey Shipbuilding Co., in July, has returned after having a trial trip, to have her interior fitted in place.

Atlantic was designed by Messrs. Gardner & for Mr. Wilson Marshall. She is 185ft. over all, waterline, 29ft. 6in. breadth and 15ft. draft. The terboard houses under the propeller shaft.

The owner's and guests' accommodations are en aft, and consist of three single staterooms, two staterooms, chart room, owner's private bedroom and main saloon, which is the full width of 15ft. long. There are three tiled bath room, one wash room in connection with the state room. The finish throughout below deck is very elaborate. There is located directly aft of mizzen mast a deck house fitted up as a smoking room. Forward the owner's quarters is the galley and pantry, and are accommodations for thirty men.

Between the main and foremasts the machinery located, which consists of a triple expansion engine with cylinders 9-inch, 14-inch and 22½-inch by 1 stroke. The steam is supplied by two Almy boilers. The machinery plant is complete with all pumps, ice machine, dynamo and engine, storage tanks, etc.; in fact, forming a complete machine stallation capable of driving the yacht at a 10½ speed under steam. This speed was actually obtained in various steam trials conducted on cruise.

Aside from the electric lighting, there is an incandescence plant installed, capable of lighting the vessel's engine is out of commission.

In order to test her rigging, spars, sails and machinery before finishing the interior, the yacht taken for a cruise on Long Island Sound from 24 to Nov. 1. Newport was as far east as the extended.

A remarkably fast run was made between New don and Newport under sail on Tuesday, Oct. 2; wind was N. W. by N., and had a strength of 3 knots. Weighed anchor New London, 7:45. Dropped anchor at Brenton's Cove, Newport, A. M. Covered distance of 43 knots, including consumed for anchoring, in 3h. and 5m.

The various times and distances as taken en are as follows:

	Distance.	Knots.
New London to Race Rock.....	5	1
Race Rock to Point Judith.....	27	1
Point Judith to Fort Adams.....	10	1
Total.....	42	1

The sailing time from Race Rock to Watch H 31m., the distance being 9½ knots, which is equivalent to a speed of 18 knots per hour. Rate of speed Race Rock to Point Judith, distance of 37 knots, 15.1 knots per hour. Tidal conditions on the race were at start, and against it when nearing port. Log actually showed at the time 16-knot.

The run was made with the fore, main and sails, working staysail and jib, spreading in all 50. ft. of canvas.

As soon as the yacht is fully completed, which will be by the first of the year, the owner intends to sail for Bermuda and thence to the West Indies and America.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii

The fifth regular meeting of the Seawanhaka-Corinthian Y. C. was held on Tuesday evening, Nov. 19, at Delmonico's, New York City. After consideration two amendments were made in the constitution. They are as follows:

Any member shall be entitled to become a life member upon payment of \$500.

The annual dues shall be \$50 for all members in class "A," and for all members in class "B" \$25.

HOUSE-BOAT—DESIGNED BY SADLER, PERKINS & FIELD FOR A CONNECTICUT YACHTSMAN.

Mr. Hueston Wyeth, of St. Joseph, Mo., has purchased the auxiliary schooner Edris. The new owner is now making a Southern cruise on the boat.

The South Coast Y. C., of San Pedro, Cal., is in a very prosperous condition. The club already has a membership of 100. Seventy-five hundred dollars' worth of bonds have been issued by the club. These will be taken up by the club members and the money thus raised will be used in building a new club house. The site is one that overlooks the outer harbor and the ocean. Plans for the new building have already been submitted. Comfort and convenience will be first considered in arranging the house. The building will be large and commodious, with a large veranda running nearly all the way around it. The lower floor will be given over to an assembly room, a glass inclosed reading room, billiard room, grill room and shower baths. On the second floor will be sleeping apartments and baths. It is the intention to make the house one where members can live and do business in Los Angeles.

In front of the club house the bluff will be terraced and at the bottom will be the locker house. The pier will extend 300ft. into the outer harbor waters.

Mr. Hollis Burgess has sold the 37ft. waterline sloop Valhalla II., owned by Mr. J. Arthur Beebe, of Boston, to Mr. N. A. Willis, of Boston, and the 18ft. knockabout Crow, owned by Messrs. Foster Hooper and Charles E. Lauriat, of Boston, to Mr. Frank W. Atwood, of Winthrop, Mass.

There is building at the yard of the Ailsa Shipbuilding Co., Troon, Ayrshire, Scotland, a large steam yacht for Mr. F. W. Vanderbilt. She was designed by Mr. G. L. Watson, and is to be 239ft. waterline, 32ft. 6in. breadth and of 1,200 tons register. She will have twin screws, which will be driven by two sets of quadruple expansion engines of about 2,700 horse-power. She will be launched some time in December and may be named Conqueror.

C. Allison Godshalk, of Philadelphia, says the Record is having built a boat which will be in some ways one of the most remarkable small vessels in the world. It is to be what is known as a power launch (propelled by gasoline) that will eclipse the speed of the fastest ocean liner and equal that of the majority of torpedo boats. To achieve this single desired re-

sult of celerity nearly every consideration that enters into the construction of pleasure crafts has been sacrificed, and even the builders have frequently protested at the radical, not to say revolutionary, features which she will embody. But Mr. Godshalk is a thorough student of his hobby, and after giving the plans his closest personal attention, has no doubt of the ultimate triumph of his ideas.

The launch will be of mahogany—a quarter of an inch thick, 40ft. long and only 4½ft. wide. With a 70 horsepower engine, and with it she is expected to develop the really phenomenal speed of 25 knots an hour.

Should the boat, which will probably be called Zip, realize her owner's expectations, she will be shipped to England next summer and entered in the Thames races for the celebrated Harmsworth Cup.

At the annual meeting of the Old Mill Y. C., held on Nov. 8, at the club house on Jamaica Bay, the following officers and committee were elected: Com., John May; Vice-Com., C. J. Mehrrens; Rear-Com., Charles Cooper; Cor. Sec., Edward Ferry; Fin. Sec., Adam Breitrack; Rec. Sec., Joseph Buehler; Treas., Harry W. Walker; Measurer, William Meyers. Board of Trustees: George McLean, Dave Van Wicklen, Otto

Kirsch, Edward Boyle and William Wheeler. Regatta Committee: Com. Henry Lange, Henry Falkenstein and Joseph Buehler. Delegates to the Jamaica Bay Y. R. A.: Com. Henry Lange and Com. John May. House Committee: William Mills, Chairman; Harry Gunhaus and John Stahle. Entertainment Committee: Andrew H. Mills, Hugo Beyer and Charles Werner.

A meeting of the Manhasset Bay Winter Club was held a short time ago.

Arrangements have been completed, by which the reception room and café in the club house at Port Washington will be heated on Saturdays and Sundays, and meals and refreshments served to members on these days.

The object of the winter club is to bring and keep the members together during the months when sailing cannot be had, and by the good fellowship so engendered promote the interests of the Manhasset Bay Y. C.

An open meeting of the Y. R. A. of Gravesend Bay will be held on Thursday evening, Nov. 19, at 8 o'clock, at the "Assembly," No. 308 Fulton street, Brooklyn, opposite Johnson street.

Prizes won during the season of 1903 will be presented to winners.

Mr. Wm. H. Hand, Jr., of New Bedford, Mass., has recently completed plans for a 26ft. motor launch for Mr. A. H. Chase, of Providence, R. I.; a 27ft. yawl for Mr. Otto C. Schoenwerk, Jr., of Chicago; a 30ft. cruising yawl for Mr. E. P. Hussey, of Buffalo, N. Y., and a 15ft. W. L. one-design class for members of the Buffalo Y. C.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of *FOREST AND STREAM* offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words written on one side of the paper only.

VIII. When practicable an outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in. While a chart will count in estimating the events of the log, it is not a necessary factor, and a log may be sent without it.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

Adrift Sixty Days in Canoes.

MR. JAMES W. DAVIDSON, our Consul in Formosa, has just told of a very remarkable journey made by sixteen natives of the Pelew Islands, who were picked up nearly dead on the island of Formosa. They were savages who had never heard of Formosa, but the winds and waves carried them to that far off shore.

Some Formosans saw the poor wretches one morning on a beach of their northeast coast; also three canoes the like of which they had never seen before. The canoes were fitted with outriggers which helped to steady the little vessels among the waves. In other respects, also, they differed from canoes common in that part of the Malay Archipelago. Some Chinese who came to the spot thought the party had probably come from the southeast coast of Formosa, and that the men belonged to one of the savage and hostile tribes. Others were of the opinion that they had come from the Bashee Islands to the south of Formosa.

The men were scattered along the beach in a very weak and famished condition. Only two or three of them could speak, but no one understood their language. They were taken to the custom house, where they were well cared for and slowly increased in strength. Only one of them died, and he succumbed from sheer exhaustion about a week after his arrival. All of them were fed on diluted food at first, as their stomachs could not retain solids.

Every one was greatly surprised when it was possible at last to learn the story of their adventures. The men had been fishing a few miles from one of the Pelew Islands, where they lived. A heavy gale came up and

carried them away from their fishing grounds. They had in their canoes a considerable quantity of fish, and during their long journey, while the sport of the waves and winds, they lived on fish, though, when their original supply was exhausted, they were unable to catch a sufficient number to meet their needs.

They drifted this way and that for sixty days, and had not the slightest idea where they were when they finally came within sight of the mountains of Formosa. The next day they were cast up on the beach; and it speaks well for the strength of their craft as well as their own powers of endurance that they should have held out so long.

When they had recovered sufficient strength to undertake the journey home, they were sent to Hong Kong, whence they obtained passage to the Caroline Islands, and soon after were taken home by a vessel plying in the island trade. Their friends welcomed them as though they had risen from the dead.

This is one of the involuntary voyages of which so many records have now been collected that anthropologists believe they adequately explain the means by which the widely severed bits of land in the wastes of the Pacific received their inhabitants. In some way or another the persons found on these bits of land must have been brought there; but the problem how they were transported could not be satisfactorily explained as the result of the expertness of oceanic peoples in navigation.

About ten years ago a patient German student named Otto Sittig collected a great many instances of the involuntary voyages of these oceanic peoples from one island to another. He found that many of them, while out at sea in their small craft, had been carried over a thousand miles to other islands. The authentic evidence he collected covered a period of about 150 years, up to the time he made his investigations.

He deduced from these facts the conclusion that the aboriginal inhabitants of hundreds of islands in the Pacific were derived originally from the inhabitants of myriad islands to the west of Polynesia, who were scattered among other lands by winds or currents that caught them while out at sea in their boats and carried them sometimes hundreds of miles from their native islands.—New York Sun.

The Forests of Hawaii.

THE forest conditions of the islands are unlike any that prevail in this country. Mr. William L. Hall, of the Bureau of Forestry, who has just returned from a two months' examination of the islands, reports peculiar and interesting problems which forestry must solve there. The islands contain scarcely any forests capable of yielding timber of value for lumber. Nearly all the lumber used for building purposes comes from the Pacific Coast. But there are several hundred thousand acres of forest land of the greatest value for protective purposes. Indeed, so great is the importance of these forests that on their preservation depends the existence of the sugar industry, and that is equivalent to saying the continued prosperity of the islands. The sugar exports of the last fiscal year amounted to \$25,000,000, and sugar is practically the only export. The raising of sugar requires an enormous amount of water, nearly all of which must be supplied by irrigation, the water being carried in flumes and ditches from the wet, mountainous parts of the islands to the dry plains on which the sugar cane is grown. The rainfall of the islands is nearly all confined to the northeast and east mountain slopes, where it is tremendously heavy, some years more than 200 inches. On the other side of the divide, and in the plains beyond, where the sugar cane grows, there may be no more than fifteen inches of rain a year.

The forests are largely confined to the rainy side of the mountains, and are necessary as a protective cover to keep the ground from washing from the slopes and the rain from rushing back too rapidly into the sea. The presence of the forest cover, since it makes the stream flow regular, preventing both floods and periods of low stream flow, is indispensable to the success of irrigating projects. The value of this forest, strangely enough, consists not so much in the trees it contains—for they are frequently low, crooked, and sparsely scattered—as in the impenetrable mass of undergrowth beneath them. This undergrowth, composed of vines, ferns, and mosses, is of so dense a character that it shades the ground absolutely and holds water like a sponge. It is, however, exceedingly delicate and easily destroyed. Let cattle into such a forest and they will speedily eat or trample down the undergrowth till the bare ground is exposed. The soil then rapidly dries out and becomes hard, and the trees soon die. Grasses, insects, and wind usually hasten the destruction. Cattle and goats have ravaged the Hawaiian forests without hindrance for many years and have worked further each year into the heart of the dense tropical growth.

Rifle Range and Gallery.

New York Schuetzen Corps.

THE New York Corps opened its winter gallery prize shooting for 1903-04 in the Zettler Bros.' galleries on Friday night, Nov. 13. As usual with this corps there was a large attendance of the members, seventy of whom took part in the shooting. The programme calls for ring and bullseye targets. The prizes are distributed at the end of the season for most points on the ring target, and for the best center shot on the bullseye target. A special prize is given by the corps for the best bullseye on each shooting night.

At the shoot on Tuesday night the best center shot was made by H. D. Meyer, who took the prize, a set of crockery (100 pieces). The scores are appended:

Ten-shot scores, two scores to count: Geo. Ludwig 240, 238; R. Gute 238, 236; O. Schwannemann 226, 238; H. Haase 223, 231; J. Facklamm 225, 229; F. Facompre 230, 223; J. Siebs 221, 231; J. H. Meyer, 2d, 221, 230; J. C. Bonn 234, 219; Geo. Offermann 221, 228; H. Michaelsen 226, 219; J. G. Tholke 220, 226; Hy. Lohden 228, 216; G. Thomas 224, 219; H. Nordbruch 220, 222; Wm. Schultz 220, 222; Hy. Rottger 215, 225; A. W. Lemcke 218, 219; H. C. Hainhorst 215, 218; N. C. Beversten 205, 226; L. C.

Hagenach 218, 213; H. D. Meyer 218, 213; C. Schultz 213, 217; H. Berckmann 207, 229; P. Heidelberger 210, 218; S. F. Stolzenberger 210, 217; Ch. Konig 211, 216; R. Ohms 222, 203; Wm. Dahl 211, 214; M. Von Dwingelo 200, 220; A. Giebelhaus 204, 215; John Paradise 202, 216; H. Decker 201, 216; H. Quenten 214, 202; Hy. Winter 206, 208; Hy. Gobber 205, 206; J. Jantzen 217, 194; M. Theu 193, 217; J. May 187, 219; F. Durks 213, 194; Ch. Mann 213, 189; C. Bruckama 205, 199; F. Feldhausen 194, 207; J. C. Kruse 203, 197; J. Lankenau 201, 189; H. Heinecke 203, 197; C. H. Wahman 183, 208; D. H. Brinkmann 190, 208; Geo. Junge 208, 183; D. Dede 186, 205; N. Jantzen 177, 212; Aug. Evers 183, 193; Hy. Koster 200, 186; C. Degenhardt 171, 200; D. Von der Lieth 165, 206; H. Horenberger 192, 181; L. Goldstein 196, 178; J. C. Brinkman 191, 170; D. Von Glahn 191, 165; A. Beckman 188, 186; Aug. Beckmann 191, 175; J. H. Doscher 176, 171; D. Von Heim 193, 144; Aug. Lederhaus 151, 177; N. W. Haaren 146, 172; G. Hagenah 145, 151; D. Ficken 178, 119; John Gobber 129, 137; H. Haaren 119, 132; B. Kumm 90, 152.

Bullseye target, best center shot by measurement, one prize: H. D. Meyer 22½ degrees, Geo. Ludwig 24½, Wm. Dahl 56, J. C. Bonn 57½, H. Horenberger 58.

Greenville Shooting Park.

A FEW of the regular patrons of this park were on hand on Saturday of last week to engage in the regular Saturday practice. The group was made up of members of the Manhattan Rifle and Revolver Club, and the Zettler Rifle Club. Wm. Hayes and Aug. Begerow, of Newark, were present, trying out the shooting qualities from machine rest of a new Stevens-Pope barrel which had just been received from the J. Stevens Arms & Tool Co. As is usual with the output of this factory, the barrel was O.K. Major Ed Taylor was on the range with a new load of Lafin & Rand nitro powder, loaded in the .30-30 shell. The Major went home satisfied with his day's experiment. Dr. Walter G. Hudson, the champion from the Election Day shoot, of Nov. 3, was also present, and devoted the afternoon to practice. In a score of 50 shots the Doctor made a total of 1149 points. This score is only one point short of an average of 23 to each shot. L. P. Hansen and H. Fenwirth, of the Zettler Club, devoted their time to practice, and good shooting.

The revolver range was occupied by Messrs. Dietz, Silliman and Wilder, of the Manhattan Rifle and Revolver Club. Scores:

Zettler Rifle Club.

THE members of the Zettler Rifle Club, at the close of the adjourned monthly meeting, on Nov. 10, held its weekly gallery prize shoot in the winter contest. The club members have not yet got settled down to the coming competition; in fact, many of them have not as yet started to shoot in the match, and the struggle for high scores will not be in full progress until after the holidays. The scores are appended, 10-shot scores, .22cal. rifles, distance 75ft:

Aug Kronsberg	244 244 242 242 247—1219
	243 243 242 243 239—1210

Harlem Independent Corps.

THIS corps, which has held its summer practice shooting during the past season at Sulzer's Harlem River Park, will distribute the prizes to the lucky members at its next meeting. The shooting was on the bullseye target for the best center shot. The following list of members are eligible for prizes:

Best bullseye by measurement: Peter G. Thometz 60, M. Wollenhagen 78, G. Thomas 85, C. Wolff 92½, Ch. Zugner 100½, E. Huber 116, E. Huelke 124, D. Muhler 134, C. Weber 134½, M. Thiebruth 140, A. Muller 141, E. Hilker 141½, E. Karl 143, B. Kumm 144, A. M. Baike 150, L. Knelin 159, H. Gaerke 165, Ch. Weise 174, Ph. Zugner 178, A. Wenzel 181½, L. Rohkohl 217, J. N. Manels 223, F. Honr 228, M. Piebrowski 232, M. Coplan 247, M. Baumann 270, S. Harvers 283.

CABIA BLANCO.

Rifle Notes.

The riflemen in and about New York want to see the Sportsman's Association revise the rifle shooting contests in its exposition in February. The rifle competitions that were held at the Sportsman's Exposition some years ago were all of them successful, in as much that after all the expenses were paid there was a surplus for the Association's treasury.

The New York Central Corps opened its winter gallery season prize shooting in the Zettler gallery on Wednesday night of this week.

The New York City Corps will hold its first shoot in its series of winter gallery contests on the Zettler ranges on Nov. 26.

Gus Zimmermann is reported to be a candidate for captain of the New York Independent Corps, at the annual meeting in January next.

The Zettler Rifle Club has an auxiliary corps, formed from the wives, daughters and friends of the members. It is known as the Lady Zettler Club. The president is Mrs. Harry Fenwirth, the wife of a prominent member of the Zettler Club. The headquarters of the Ladies' Club is at the Zettler Bros.' gallery, No. 159 West Twenty-third street. The Ladies' Club will begin a series of bi-monthly gallery shooting on Nov. 21. The coming season will be the second in which the ladies have entered into rifle contests in the gallery.

At the Election Day shoot at Armbruster's Park, in Jersey City, on Nov. 3, some of the riflemen took liberties with Dr. Hudson's cartridges to find out what sort of a load the Doctor was using, that enabled him to make the extraordinary score that he made at the time. The Doctor uses in his shooting a Bal-Pope .33cal. rifle, .32-40 shell, King's FG Semi-smokeless powder, primed with 5grs. Dupont's No. 1 Smokeless and Peters 2½ primers. The shells that were taken from the Doctor's cartridge case were loaded with plain semi-smokeless. The Doctor explains the matter this way: In loading his shells for the 100-shot match he ran out of nitro, and in order to have surplus cartridges for preliminary practice, he loaded the balance of his shells with plain FG semi, and these were the shells that the inquisitive riflemen got hold of.

Geo. D. Wiegman, one of Newark's prominent riflemen, also an old member of the Zettler Rifle Club, died at his home in Newark, on Sunday, Nov. 15.

Match for Championship, Fort Wayne, Ind.

A MATCH for the live-bird State championship of Indiana was shot on Nov. 10 at Fort Wayne, between H. M. Clark, of Wabash, and Max Witzgreuter, who won the title from Clark a while ago. The conditions were 50 live birds and \$50 a side, and Clark won by one bird. The scores: Clark 46, Witz 45.

Witz immediately challenged Clark for another match, same conditions, and was defeated the second time by a score of 48 to 45, Clark making 94 out of the 100, a new record for these grounds.

On the same day J. Smiley, of Matthews, Ind., and Wm. Ferrell, of Muncie, shot a match at 50 birds, \$50 a side, resulting in a victory for Ferrell by a score of 42 to 30.

A match at 100 live birds, \$200 a corner, is being arranged between Clark, Ed Voris, of Crawfordsville, and Witzgreuter, to be shot at Indianapolis. The winner to take the entire purse.

BONABA.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 21.—Brooklyn, N. Y., Gun Club shoot, 100-target allowance handicap; \$5 to high guns. J. S. Wright, Mgr.
Nov. 26.—Chicago, Ill., Gun Club Thanksgiving Day shoot. A. A. Waters, Sec'y.
Dec. 9-10.—West Baden, Ind.—Baden-Lick Club amateur live-bird shoot. J. L. Winston, Mgr.

DRIVERS AND TWISTERS.

At the shoot of the Sheepshead Bay, L. I., Gun Club shoot on Saturday of this week, the main contest will be for the Dr. Knowlton cup, the conditions of which are 50 pairs, all standing at scratch; no handicaps. Also, on Thursday of this week there will be a club contest, open to members only, for a special prize.

The Brooklyn Gun Club, John S. Wright, manager, will give a shoot Nov. 21, at 1:30 P. M. sharp; 100-target handicap, target allowance, for gold watch; entries 50 cents, targets extra; optional in this event; \$5; no handicap; high guns. Kaiser's Farm, Old Mill Road, Kings County "L" to Crescent street station. Hacks to grounds.

A Theory of Choke Boring.

From the London Field.

AMONG the large number of problems still awaiting solution in connection with the behavior of shotguns are many which have been carried a certain distance by experimentalists in the past, and which might be carried further by the help of modern appliances and the more exact knowledge of underlying theories which now exist. Considering, for instance, how long choke guns have been in use, it is surprising that a satisfactory explanation of the action of the choke in condensing the patterns has yet to be found. The most plausible to our mind is one which we believe has not before been stated in print. It is that by the action of the choke a wave pressure is created in the column of gas behind the shot, which modifies the disturbing influences of the blast of gas issuing from the muzzle after the shot has gone out.

In other words, the action of the choke is very similar to that of an obstruction in the barrel. The extra resistance encountered causes a check in the forward movement of the shot, whereby the velocity is reduced by a certain number of feet. The piling up of the gases behind the over-powder wad that results from the delayed movement of the shot would necessarily cause a high local pressure immediately to the rear of the wad. This high local pressure would create a tendency for the gases causing it to rebound from the wad, so driving backward against the advancing gases that fill the remainder of the barrel. Supposing that the shot charge thus leaves the muzzle at the critical moment when the forward movement of the gases is momentarily delayed, it would stand a chance of getting well on its way up the range before the jet of gas fully re-establishes its forward movement. Deductions from experiments already published go to prove that the gases leave the muzzle at a velocity of something approaching 3000ft. per second, which would conceivably enable them to impinge against the shot, and so cause a slight scattering effect, which would be particularly marked in cases where the wadding is caught by the full strength of the outrushing gases. If, therefore, the spreading of the charge of shot may be attributed to the emerging gases blowing the charge from the straight line of fire, it is quite easy to see that the presence of a partial obstruction near the muzzle would modify the scattering effect by creating a wave of back pressure to resist the forward-traveling column of gas.

This theory seems to fit in with most of the experiences of practical gun-makers in regulating choke guns. First of all, one knows that the greater the reduction of the bore at the choke the greater is the concentration of pellets. More than this, it frequently happens that a choke which has the correct shape and adjustment may fail to produce the needful concentration of pattern, and that the effect of the choke may be entirely altered by boring out the barrel so as to bring the constriction nearer to the muzzle. Following out the theory above presented, one might assume that the alteration of the position of the choke modifies the time of the delay of the rush of gases, whereby the shot would get sufficiently away from the muzzle before the forward movement of the gases was fully re-established.

In other cases where it is found that a choke fails to produce the desired effect, it frequently happens that by increasing the abruptness of the cone of the choke the required concentration of the pellets is obtained. In true cylinder guns another very interesting illustration of the theory can be adduced. In carrying out experiments with true cylinder barrels, we have frequently been surprised at the remarkable variations of pattern from shot to shot experienced. Four successive shots may give an average distribution of 140 pellets on the 30in. circle; then may follow a succession of three or four shots with an average of 100 pellets; and it is almost invariably found that in every ten shots there are one or two rounds where the pattern displays the peculiarity which is commonly known as "blown all over the plate." Very low patterns, counting as little as sixty pellets in the circle, are thus obtained, and one must assume their presence to be due to the violent impact of the felt wad against the cluster of shot soon after it has left the muzzle. In proof of the fact that the tendency of choke boring is to delay the movement of the shot, an illustration may be quoted which has been proved by numerous experiments we have recently conducted. It is that careful measurements of the muzzle velocity with choke and cylinder guns show that the average records with choke boring display inferior velocity on the part of the choke gun to those encountered with the cylinder. The difference referred to may amount on the average to 30ft. per second, which might well be reckoned sufficient to influence the behavior of the gases at the rear of the shot.

Supposing that this theory of the influence of choking in gun barrels is the correct one, we have in it a very satisfactory explanation for the marked partiality of sportsmen for what are known as improved cylinder guns. In this class of gun there is an extremely small amount of choke, which seems to have a marked influence upon the shooting results obtained. In fact, with an improved cylinder one generally obtains patterns averaging very closely to 140 pellets, whereas with the true cylinder the patterns obtained represent a mixture of records representing two extremes, say 140 on the one side and 100 on the other. Here, for instance, is an actual series of patterns which fairly well illustrates our argument: 129, 137, 131, 130, 80, 97, 63, 121, 129, 65, average 109. Another gun of similar boring was shot for comparison, and the following series of records was obtained: 145, 100, 146, 104, 99, 134, 135, 97, 65, 132, 125, 103—average 115.

The distinction between true and improved cylinders seems to be that the improved cylinder gun gives with considerable regularity the patterns which a true cylinder would give, but for the apparent presence of a disturbing factor that seems to spoil about half the readings. In fact, we regard the natural distribution of the true cylinder gun as about equal to that of the improved cylinder, if only we could get rid of the disturbing influence which one may well assume is due to the impact of the waddings against the charge. Professor Boys's experiments in the photography of shot charges at the moment of emerging from the muzzle shows the cluster of shot lying in a fairly compact body, with the wad at some point between it and the muzzle. Assuming the velocity of the powder gases to be about two and a half times that of the shot charge for the first 12in. of travel beyond the muzzle, one can easily see that the blast of gas would be quite capable of making the wad overtake the shot and disturb its flight. On those occasions when the wad is driven at a tangent from the line of flight of the shot, the charge would only be disturbed by the blow from the gases. If, on the other hand, the wad happens to strike the cluster of shot, the regular arrangement of the pellets would be likely to be badly disturbed. It may be assumed, for the sake of argument, that the virtue of the improved cylinder, and in fact, of all other forms of choke, consists in the fact that the muzzle blast is so modified and delayed as to allow the shot to get sufficiently clear of the muzzle before being overtaken by the onrushing gases to get rid of some of their most injurious effects on the flight of the pellets.

Numerous experiments could be made to test the theory here evolved. One might, for instance, insert a small metal ring at the muzzle of a barrel so placed as to cause a check at the moment of final exit of the shot. By comparing the results obtained with and without such a ring in the muzzle of a true cylinder, important and novel information might be obtained. Similarly, one might drill a number of holes around the muzzle of a true cylinder gun, the idea of which would be to allow the escape of the gases before the shot had actually reached the muzzle, and thus largely modify the outrush of gases that would ordinarily exist. However ingeniously such experiments might be devised, the resulting inferences would only prove the correctness of the theory by deduction, though of course the body of circumstantial evidence so established might be well-nigh overwhelming. Most authorities are agreed that the amount of scattering observed with a charge of shot is greater than would exist from the natural deviation of a conglomeration of pellets projected toward

FOREST AND STREAM.

VOL. LXI.—No. 22.
No. 846 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

Epitaph in the Churchyard at Hythe.

His net old fisher George long drew,
Shoals upon shoals he caught,
Till Death came hauling for his due,
And made poor George his draught.
Death fishes on through various shapes;
In vain it is to fret;
Nor fish or fisherman escapes
Death's all-enclosing net.

THE INDIVIDUAL AND THE CROWD.

THE passion for power and the distinguishing superiority incidental to it, seems to be a trait common to all mankind, whether savage or civilized. Whatever the laws of any section may be, the final arbitrament rests on physical force. While there is a government for all the people, it can in the main consider the generalities of the social compact. Each class of people, whether differentiated by business, leisure or amusement, has its own special class laws and customs, all established and maintained by the parties interested. Experience has proven the wisdom of these wise regulations, the product, the conventional product consequent to generations of experience.

But with more or less formal or informal organization, there accrues thereby greater power to the organized than is possible to the lone individual. With the many benefits of organization, there are always associated abuses. In every organization of any importance outside of its own circle, there is always a small, refractory, insubordinate and lawless element, ambitious to distinguish itself, to arrogate to itself the power of authority, and to violate the law of the land whenever it contravenes their humor or interest if it can be done with impunity.

A man or boy, in this connection, will not attempt, or even think of attempting, in his individual capacity, what he will attempt in his associated capacity as a member of an organization.

Individually, the atmosphere of the law is about him everywhere; as the member of an organization, the responsibilities are all merged in the organized body as a whole, and no individual feels that it is personal. This gives the malevolent, the mischievous, and the lawless an opportunity for free activity under the protecting prestige and power of the body as a whole.

Thus, as a side product of organization, is the pernicious custom of college hazing by college classes, which has a basis only in mischievous propensities, with physical power of enforcement possible of exercise only under the peculiar conditions of isolation common at colleges, and which, as an idea, can have its origin only in immature or ill-ordered minds.

As a matter of sound reason or common justice, the abuse, hazing, could not soundly be maintained for a moment in serious debate. It is merely the manifestation of arrogated power with an egotistical purpose to exalt the class engaged in it at the expense of the humiliation, forceful subjugation and, betimes, bodily injury, of those who by mere propinquity are available, and who by circumstances are defenseless.

Labor unions, with beneficent purposes in the main, tolerate abuses of their organized power by forcible interference with others, the principle between union hazing and college hazing being indistinguishable on any question of right.

Shooters, who go afield lawlessly—and there is a distinction sometimes between shooters and sportsmen—commit depredations when temporarily banded together, which they would not dare to commit as individuals, and this they dare do on account of the divided responsibility and the feeling of combined physical power.

But the law of the land overshadows all, and there-

is no doubt that in good time all who violate the laws of the people, whether from the lesser offenses of college hazing to the greater ones of mistaking a man for a deer, and thereupon killing him forthwith, will all find their legal status in good time.

CURRITUCK SOUND.

REPORTS from Currituck Sound indicate that the opening season showed a great abundance of wild fowl there. At the Narrows Island Club, the first ten days of the shooting showed over 600 birds to four guns.

The new game law providing for the appointment of wardens and deputies by the North Carolina Audubon Society appears to be working well. The game warden for the county is reported to be doing his duty, and as having already secured two convictions of persons violating the law by leaving the wharf before sunrise. There seems to be no night shooting, and guns are never heard after sunset, as they have been for a few years back.

It is thought, however, that the taxes from non-resident gunners will not provide enough revenue to pay the wardens through the season, yet the efficient work which they are doing seems to render it important that they should be kept on. The men who kill the most birds and who thus derive the greatest benefit from the abundance of birds, are those who shoot from bush blinds and batteries for the market, and the very reasonable suggestion has been made that these gunners, who have the cream of the shooting, should pay a tax as the non-residents do. If the law were so amended as to provide that all gunners shooting afloat should pay such a tax, there would be a considerable increase in the revenue, and the gunner would scarcely suffer, since a single day of good shooting would pay his tax for the whole season. Of course such a measure would not be popular with gunners along the Sound, but it would help to pay the expenses of the wardens and would undoubtedly increase the supply of wild fowl and make better shooting.

THE SCARCITY OF GROUSE.

FROM many quarters of the country, from Canada, from different parts of New England, from Ohio, and from Michigan, comes the news, dismal to all sportsmen, of an unusual scarcity of ruffed grouse. With this news come also explanations of this scarcity, but most of them unsatisfactory, because apparently not the result of study and investigation, but off-hand guesses of no value whatever.

We are reminded that while the spring and first weeks of summer of 1903 were remarkably warm and dry, offering conditions very favorable for the hatching of the eggs of the grouse, these weeks were followed by a long period of abundant and heavy rain, which, coming at the precise time of their greatest weakness, may very possibly have destroyed a large number of the chicks hatched. This is a mere hypothesis, supported, so far as we are able to learn, by no facts whatever. Nothing is easier than to devise a theoretical explanation of some natural phenomenon and then to cast about for facts to support this explanation. In this case we are as yet absolutely without facts.

On the other hand, the reports of the scarcity of grouse from a very extensive territory probably have some foundation in fact, and we should greatly like something more specific in considering this subject.

Last week we asked our readers if they would not report to us as to the numbers in which they had found woodcock this autumn, and we should be greatly pleased if they would report to us also as to the abundance or scarcity of the ruffed grouse.

We recall a period of grouse scarcity, twenty-five or more years ago, and that to explain it an elaborate theory was devised, supported—as then supposed—by observations extending over a considerable territory. As we recall it now, these observations were based wholly on error. The cause of the scarcity of grouse was not what it was supposed to be.

Even in the case of a bird so familiar to so many men as the ruffed grouse, it is an exceedingly difficult matter to become acquainted with all the conditions under which it lives, and with all the influences which—favorably or unfavorably—act upon its life and growth.

In many of the localities from which reports of their scarcity have come, we may feel positive that neither the gun of the sportsman, the cunning depredations of the fox, nor in fact the attacks of any birds or beasts of prey have had any appreciable influence in diminishing the numbers of this splendid game bird.

Among the readers of FOREST AND STREAM there must be many who have studied the grouse more deeply than the average sportsman, and who should therefore be able to contribute facts or suggestions as to its life history which might be of use in solving the mystery of its present scarcity, as well as many other points of interest. But the first question on which our sportsmen desire to be informed is whether in this autumn of 1903 the ruffed grouse are less abundant than usual.

It has been stated in the London newspapers that carrier pigeons have crossed the Atlantic Ocean, and this is said to have taken place in the year 1886, when, according to the account, three out of nine American carrier pigeons set free in London returned to their home lofts on this side the water. A writer in the London Nature asks for more specific information about this alleged fact. Did or did it not happen? If such a flight took place it must have created more or less of a sensation among carrier pigeon fanciers, and records of it must exist. Is anything known of this matter on this side of the water?

OUR CHRISTMAS NUMBER.

THE Christmas Number of the FOREST AND STREAM will be the regular issue of December 5. It will be enlarged to fifty-two pages and will be profusely and handsomely illustrated. Among the features will be the following:

PRESIDENT ROOSEVELT AS A SPORTSMAN. With portrait of the President in his office.

MASHPÉE. A celebration of the charms of the Mashpee, prompted by letters of Daniel Webster. By James Russell Reed, President of the Massachusetts Association.

THE STORY OF A STUMP. An account of big-game hunting and exploration in the Northwest. By H. G. Dulong.

ANGLING IN THE SEVENTEENTH CENTURY. A reproduction of an angling print of the year 1686.

THE LOWERING FLIGHT. A full-page drawing by Wilmot Townsend.

THE BOY OF WINANDER. Wordsworth's poem, illustrated with a half-tone reproduction of the painting by Walker in the Library of Congress.

THE STATE DINING ROOM OF THE WHITE HOUSE. Two full-page views showing the game heads with which, under direction of President Roosevelt, the room has been decorated.

AUDUBON'S PORTRAITS OF BIRDS. Three full-page reproductions direct by photography from the originals of Audubon's plates of the wild turkey, male and female, and the Labrador duck.

MULE DEER IN THE YELLOWSTONE PARK. Five pictures from photographs from life.

WHEN THE FROST IS ON THE PUMPKIN. A full-page drawing by W. P. Davison.

THE HOME OF THE ALBATROSS. An account with pictures from life photographs of the great albatross colonies on the island of Laysan.

THE KILLDEER PLOVER. Two illustrations from life photographs.

HOW TIM MULCAHY GOT SHOT AT FOR A DEER. A Christmas story by Francis Moonan.

THE STEAM YACHT NOMA. A profusely illustrated description of this well-known boat.

THE WITCHERY OF BLOWLAND. A story by B. Waters in lieu of trap scores.

The Christmas FOREST AND STREAM will be of exceptional interest and value. The number will be among the handsomest publications of the season. The price will be 25 cents. Order from your newsdealer in advance.

The Sportsman Tourist.

Floating Down the Mississippi.

II.—St. Louis.

I LEFT Northwood just as the leaves began to assume their most gorgeous autumn hues. One is tempted to think that each season in the Adirondacks is the loveliest. Winter is cold and clear and crisp, and summer warm and beautiful, and in the spring the trout bite, and in the fall the leaves turn—so at any time the resident there turns his back on the region with regret, even if going to some place more famed or of more human interest. The first stage of my journey down the Mississippi River was, of course, to the banks—shores—of that stream. I went by way of Buffalo, stayed there over night that I might see as much of the land as possible by daylight. I had in mind a continuous daylight tour, but had to wait five or six hours at Cleveland, and so had only a glimpse, as one might say, of the wide, flat prairie lands of Illinois. Of course, I don't know what I didn't see, but all that I did from Cleveland to East St. Louis were some clumps of trees somewhat like bouquets, arranged around houses and farm buildings, some monstrosously large corn fields and long fences. Some of the woods were natural, and there were enough trees to interrupt one's view of the horizon at the end of the prairie—a very monotonous view, but entirely necessary in the economy of the world, and one not without its beauty to humanity. In fact, the traveler into the mountain country is usually told that he ought to go over in the next county, for "there's a good country, yes sir! Finest farms ye ever see; that's a fact, stranger!" To the man who wants to see fine farms I commend the cultivated prairie.

When the train pitched down into the valley of the big river and the names on the stations, corresponding with those on the time table indicated that the Mississippi was "coming, but an hour late," my interest grew as I watched the ground go past. After a time we came to a multitude of switches, and almost immediately we were going pellmell through banks of freight cars, as usual, just when I wanted most to see what was beyond. But we climbed an embankment, and then there were ponds of water, a something that seemed to be a dirty, yellow creek—calohkia?—then more freight cars and a town on many of whose buildings the water mark, done in yellow, was conspicuous. Some of the houses were out of joint, one corner hoisted and the other settled in a more or less extravagant manner. About this time the porter came and said, "Brush you, sir!" and as he brushed I didn't notice what the train was doing. A few moments later, when I sat down, I observed that to the left was a wide stream, and after a couple of sweeps of the eye came to the conclusion that it was the Mississippi River, down which my way was to lead. The train had just crossed it. It was here that I felt disappointed by what I had come to gaze upon. Such looking water I had seen only in foul puddles in roads or roadside ditches, and I actually reassured myself as to the size by a memory of the Tennessee. I presume that the ride across the prairies had changed the focus of the eyes, and the proportion and perspective of things was too well calculated to show the immensity of the features that were before me. But at each look the size seemed to increase—which it has not failed to do down to this writing, in a chute opposite St. Genevieve with my boat tied to Moro Island willows.

The river is the last thing an average citizen of St. Louis would take a visitor to look at as a town sight, perhaps, especially these days when they are thinking mostly about a fair which they expect to hold next year. "Have you seen the fair grounds yet?" is likely to be the first thing any one asks a stranger, but these citizens are seldom associated in the remotest degree with the everlasting continuous performance—vaudeville, comedy, tragedy, ay! and opera, too, which is called The Mississippi, and various other things, depending on circumstances. The ones faithful to the river do not say, "Have you seen the Mississippi?" but "You just ought to have seen it," at some memorable time, as last spring, when its waters crept up the streets leading down to the levee, when dismembered houses floated past with big trees stripped of all but the largest roots and branches, plunging and sawing their way through the other drift, and when the wail of human distress was heard and answered from side to side of the continent because the Mississippi was "out of its banks."

After one has talked with a man who has floated on, fished in, watched, loved and drank the Big River for a dozen years, a mere city looses its hold on one's interest somehow, and the thought of such common things as stores, theaters, principal streets and such like fail to awaken curiosity, but St. Louis has claims almost if not quite equal to those of its neighbor, the river.

I was in town ten days, and was unusually fortunate in having a cousin, Jimmie Smiley, for guide. Being a useful citizen, Jimmie works by day, so we had to see the sights by night. It will be remembered that one of St. Louis's famous mayors said to some citizens who complained that there were too few lights in town. "You haf the moon yet, ain't idt?" I was told the first night that I would better leave my valuables at home lest I get held up. I expected to see a pretty bad town, something wild, wooly and hilarious after that, but judged by New York, St. Louis looked a good deal more reputable, clear-eyed, quiet, with a good deal of the big country village in the bearing of its people. The newspapers have items from surrounding towns like a county seat local, but they have the national news, too. One is startled by such words as "saloonist" and "feudists," and there is a noticeable use of the "prominent citizen" style of personal. And these papers live in as fine offices as one can find anywhere—clean, wealthy and not gaudy, but dignified, so

it is plain that they satisfy their constituents, and "oldest subscribers."

The City Hall is a good, big structure looking up Walnut street. "I don't suppose it will ever be finished," Jimmie said. Answering to "why?" merely the word "Politics." "What's the matter here in politics, anyhow?" I asked. "Don't the people vote?" "That's just the trouble," Jimmie replied, "they vote too often." It was light on a dark subject.

I don't know any better way of describing St. Louis and its nature than to make mention of certain signs posted conspicuously on some of the churches, which read about like this:

NOTICE!
\$50 Reward will be paid for
Information leading to the
Arrest and Conviction of
Any One
Doing Damage to this Edifice.

St. Louis has churches, and it is needful that the lovely stained glass windows be protected from the missiles of irreverent individuals. One may guess from this that St. Louis is a place of many contrasts. One can travel along Olive street and, noticing the furnished room houses and the occupants on the front steps, will see that to this city many young men have come in order to "push ahead." The competition in "getting on" is great—so large and by such able men that the city is spreading out in a fashion that leads some of the leading citizens, and others, to believe and say that it will one day make Chicago rustle for an alliance. If they could have the river made into a deep sea highway, and St. Louis an ocean port, then St. Louis in the middle of the continent, with its command of traffic North, West and South—well, it is said the town is beyond the days of boomers, but the citizen can still wax eloquent, more especially the real estate dealer.

A good deal of Western history centers at St. Louis, beginning way back with Laclede, and coming down to the expeditions to explore the West of a few years ago. The history of New Orleans, with its foreign connections—French and Spanish—has perhaps a more individual character, but one must consider St. Louis as a part of the great West, the center of the romantic trade which gave rise to such things as the keelboatman, the raftsmen, the American houseboatman, the inland steamboat traffic—with its greed manifested of old, in races of a most remarkable character. Local historians, in the face of scores of records of steamboat explosions and other disasters, say that it is utterly impossible to collect anything like even approximately accurate data of the losses in life, property or even the number of boats that were destroyed on the river. That long, stone-faced levee of St. Louis, almost empty now, but once the scene of the smoky confusion attendant on much steamer traffic, has in its story much romance. Something like sixteen hundred lives were lost right there in one explosion, and who can tell what gamblers, slave roustabouts, rich planters, poor fortune seekers, successful and unsuccessful lovers came to that place, now in the shadows of the elevated steel railroad structure which runs along the top of the levee?

This part of the story of St. Louis has come to an end now. A new story is likely to begin there on the levee—a mere step, with sloping river face—some day, for Major Casey, under the Mississippi River Commission, is taming the great river as far as Cairo slowly, but it is believed, surely, and a new trade may come to give the river a book of figures, but never such another as one can get hints of in Mark Twain's comparatively tame "Life on the Mississippi." Devol's rather exaggerative "Life of a Mississippi Gambler," or Gould's curious compilation called the "History of Steamboats on the Mississippi." And these hints are all that remain of the vast number of happenings which are commonly called "human interest." If there were much more than hints, it would take a considerable library to contain them. As it is, the Mississippi River Commission ought to collect all the documents relating to the river. As things are now done, if a steamer blows up, the name is merely marked off the list. There are some private collections of Mississippi books, and every historical society of a State adjoining the river have river materials naturally. In St. Louis there are collectors of Americana relating to the Big river, or, perhaps, the local reporter would call them "collectors of Mississippiana," and let it go at that.

Just at present most of the young people of the city are going to dances, public and private. The dancing masters have large classes, clearing considerable profits from the price of admission as well as from pupils. Hashagen's is a distinct and unique institution. Three or four brothers, having in mind, perhaps, the Coney Island music hall and vaudeville, and a dancing platform, combined the two with a beer garden, with such success that the season opened a few nights ago with an attendance of 4,000 persons or thereabouts, not one in a hundred of the men present was able to boast a mustache. A large proportion of the girls were in short dresses. Clerks, office boys, errand boys, girls from the tobacco factories, cash girls, and the like were there in the hundreds—"owning the place." Every night, Sundays included, a thousand or two go to this hall and dance, meet their friends, and watch more or less amateur talent do various stunts on the stage in a great room adjoining the "ball room" at the rate of 25 cents for the men and 10 cents for the women. Beer, the universal St. Louis drink, and soda water are sold at the tables, the waiters are not insistent. When the dancing fad gives way to something else Hashagen's will fade with the other halls, but for the present the alternates of dance and show, both short, commands a larger attendance by far than the "wine gardens," and their mere shows—and much more reputable.

In the summer time St. Louis has the usual resorts to which the citizens go to get fresh air, and one may ride 18 or 20 miles out of town on a trolley car. Jimmie told of taking such a ride and being stalled by the car jumping the track. He got home some time

after daybreak. But to the Easterner these things aren't a circumstance to the excursions on the river in which there are two or three big river steamers engaged. When the floods are at the highest the steamers advertise "Flood excursions," and invite every one to go out and look at the high water. The prices are surprising. One may go to the flood for the reasonable price of 25 cents, and the sights at such times are not to be imagined. Last spring homes of every lowland description passed under the Eads Bridge, some of them in such good condition as to make the counting of the stories, and even rooms, possible. Thousands went to see the sights of the drift and shore. In East St. Louis newspaper men, who took photographs, were run out of town by real estate dealers. The real St. Louis—in Missouri—is on a bank so high that only the water front is affected—a water front of warehouses and rooster saloons.

Probably the feature of excursion life in St. Louis that is most interesting is the fact that all summer long, night after night, two or three of the largest boats on the river carry people free down the river forty miles or so and back again. No fare is asked, but the bar bills pay expenses and the profit necessary. One can fancy the result of "free excursions" on New York's East Side, which turns out so strong when a 5-cent fare to Coney Island is had. So far as I learned, it costs the citizen of St. Louis to be amused about 25 per cent. of what it does even an Adirondack woodsman. I don't know about the theaters, for the sights of any town—the real ones—are to my mind far more interesting than any imitation ever seen before the footlights—but this is not to say that I won't go aboard the floating theaters, of which there are several on the big river, at the first opportunity. It is said these shows are considerable to look at.

I found the days of my stay in St. Louis to be of constant interest. At the office of the Mississippi River Commission Captain Ladue told of some of the features which make the commission one of the most remarkable institutions under the Government—its fight with the river, which changes its height countless times every year, and at each change begins to undo the work of a dozen other stages, and begins other work of its own. Captain Ladue gave me many facts that were necessary to understand what is done by and to the river. In speaking of one feature of the work, he said:

"We work down with our dredges and get a channel made which is good and fit; but just then along comes a flood bulling right through, undoing all that was done before, and compelling another dredging."

A barber at Commerce said later to me: "Yessah! The St. Francis has the look of goin', but hit ain't the body. This yere Mississippi—hit don't look hit, but hit sure has the body; yessah!"

There was that in the tone of Captain Ladue's voice when he spoke of the Mississippi flood "bulling through" that told the whole story of the Government work on the river. The tone was indicative of the weariness in the work of dredging, of doing the things over and over again. I secured the maps of the river issued by the commission, and these are the most interesting descriptions of the river's nature that one can find—sand bars, and towheads, cutoffs and bends.

Mr. Horace Kephart helped me in regard to my inexperience in river camping more than I ever was before in so short a period. He suggested carrying a sponge to wash out the boat, and a few days later, in the hardest shower of the season, that sponge saved me many kinds of discomfort, as I squeezed it dry after soaking up some of the water which fell in the ends of the boat just at daylight. The warning as to the caving banks, mud in the mouths of creeks, not landing in willows, etc., have all come into use—so I have many reasons for being grateful to Mr. Kephart, and to St. Louis, where I met him.

On Oct. 3 I was all ready to start down the river. I had made all my purchases of groceries, and other things, and with a day to spare to remember forgotten things thrown in, I ordered an expressman to come round to take my duffle down to Medarts, where it was all to be loaded on the clinker skiff and sent afloat. Time 9 A. M., on Saturday, Oct. 3, sure. But it was 10:30 on Saturday when the expressman came, and another delay getting into the water, so it was finally 2:35 P. M. when Jimmie and I went afloat in a strong wind up stream, which tried the boat considerably more than I wished once we were beyond the eddy, where we launched.

Jimmie was going down the river and spend the first night with me for luck, and then come back on the cars. Having launched at the lower end of the city, we soon had a distant view of the sort that is always beautiful—a wind throwing the black coal smoke above dimly seen buildings, beyond a wide, tossing sea-like expanse of water, growing more distant, more ethereal, the slosh and chuck of the waves being the only sounds to be heard, save in the rush and tumble when piles of rip-rap sent the current away from caving banks. We dropped below Carondelet, and then were running through the willow land.

RAYMOND S. SPEARS.

Virginia Shooting.

A NUMBER of sportsmen are taking advantage of the opportunities offered by the management of the Hotel Chamberlin, at Old Point Comfort, and several good bags have recently been brought in from the game preserve on the peninsula, near Jamestown. Mr. E. N. Gallagher and Mr. C. B. Caldwell, of Philadelphia, got over one hundred sora, and Mr. Homer, of Philadelphia, thirty-six quail and a wild turkey.

The camp in connection with the preserve is perfectly comfortable and convenient. The cabin is of pine logs, and has a very large open fire, with facilities for the best sort of camp cooking. Patrons of the preserve who remain over night for early morning shooting are absolutely sure of comfort.

There are great numbers of wild turkeys particularly. No section of Virginia is so rich in this magnificent game bird as the section embraced by the game preserve of the Chamberlin.

The Lodges of the Blackfeet.

(Concluded from page 395.)

On the southern side of the circle is a lodge belonging to Head Carrier, an old man of some importance and possessed of some spiritual power. The painting of this lodge is very old, and I have no adequate explanation of it. The black band close to the ground is unmarked, but above, and resting on it, are a number of black, roughly circular paintings, which represent the heads of enemies. On the front and on the back, and so with their extremities almost touching at the ground on either side, are two rainbows in three colors, red, blue, and black, from below. Each runs from the black band at the ground nearly to the smoke-hole, and so forms a high, narrow arch. Within the rainbow, at the back, is the full-faced figure of a naked man, about three feet high. The figure is painted in reddish brown, but the hair, heart, life-line, and kidneys are bright blue. The man holds in his left hand a pipe, which he is filling in order to give the sun a smoke. In his right hand he holds, by its handle, an

HEAD CARRIER'S LODGE.

object with the outlines of an ordinary palm-leaf fan, from the outer border of which project a number of eagle tail-feathers. These tail-feathers he is about to present to the sun. The butterfly cross is below the smoke-hole, in the usual place.

Growing Buffalo's lodge shows on the south side a male mule-deer, and on the north side a female mule-deer. The color of each is bright yellow; the life-line is red and green in alternating blocks. The kidneys, knees, hoofs, and rump patch are green, the teats and genitals red.

White Dog's lodge shows the usual band with the "dusty stars" at the ground, and resting on this band are conical or oval figures, the conventional signs for mountains. Besides these, at the back of the lodge, and resting on the band, is another conventional sign—that for a pine

WHITE DOG'S LODGE.

tree, a broad, sharp cone, from the sides of which project slender, upright lines a few inches long; this is yellow. Almost half-way up the lodge, on the south side, is a male snake, and on the north side a female snake; these are red, yellow, and blue, in sections. At the top of the lodge, below the smoke-hole, are three narrow red and three narrow yellow bands alternately; these represent red and yellow clouds. The very top of the lodge and the wings are black (the night), with six stars (the Pleiades) on the wings.

Red Head's lodge has the base-band red, and resting on it are the conventional mountains. At the back and front of the lodge, rising well toward the smoke-hole, are great red paintings three or four feet wide, six or eight feet high, rounded above and resting on the band below. These represent the great masses of rock often seen on the prairie, and against which the buffalo used to rub themselves—erratic boulders dropped by the glacier. Hanging down from the smoke-hole behind are four

RED HEAD'S LODGE.

horse-tails. They represent four horses stolen by the maker of the lodge.

Stingy's lodge is old and faded. The band below contains large circles—stars. Above, about half-way up the lodge, an undulating band, twenty inches wide, runs around the lodge; it is composed of three narrow brown and two narrow red stripes, which is believed to represent a river. Above this band, on the south side, is seen a male eagle in flight, showing one of the wings; and on the north side a female eagle flying, also showing one wing. On the north side the lodge-wings bear four stars which represent the Pleiades, and on the south side seven

LONE CHIEF'S LODGE.

stars—the Great Bear or Dipper. Behind and below the smoke-hole is the butterfly cross with the horse-tail hanging from the middle. The horse-tail brings good luck; he who has it on his lodge is likely to be fortunate in securing horses, and to have many of them. Also it is suggested that the lodge is sold for horses.

Three Bears' lodge has around the bottom a yellow band showing "dusty stars," and with mountains resting upon it. Above that it is unpainted until the smoke-hole is reached; about this the lodge is painted yellow, and hanging down from this yellow painting, the border of which is horizontal, are pairs of conventionalized eagle-

SINGLE CIRCLE LODGE.

claws. The claw to the south is blue, and the one to the north, yellow. The wings show stars—the north wing the Great Bear, the south wing the Pleiades. At the back, below the smoke-hole, is a representation of the sun with a horse-tail tied to the center. Above, and on either side of the door, is a blue painted circle, in the center of each of which are bells and a bunch of raven feathers, and from the center of these circles run the strings by which the door hangs. This door must be a calf skin with the fur left on it.

This lodge was discovered in the following way: Once a man with his son was out in winter hunting buffalo, and as they were returning to the camp, the two were overtaken by a severe snowstorm and lost their way. They made a shelter for themselves from the green hides that they were carrying, and lay down in it and slept. In his sleep the man dreamed that a person came to him and said, "Friend, I invite you to come to my camp." He accepted the invitation and his host told the lost man that he wished to make him a present of a lodge. In front of

YELLOW-PAINTED LODGE.

his own lodge the host put down two blocks of wood, painted different colors, and requested the lost man to take his choice. He did so, and the block which he chose was painted as this lodge is painted. When the lost man awoke, the storm had ceased and the sky was clear, and with the boy he went home to the camp. When spring came he made himself a lodge and painted it as he had seen the painting on the block of wood.

After that, no matter how dark the night or how bad the storm, this man never lost his way; the lodge brought him good luck.

Old Running Rabbit's lodge is called the Single Circle lodge. It has only a single ornamental circle about it. It takes its name from the man who designed it. Single Circle Lodge was a beaver priest, and this lodge undoubtedly had its origin from the Beaver society. Its

SHORT ROBE'S LODGE.

discoverer dreamed that the otter and the beaver gave him the lodge.

About the lodge, four or five feet above the ground, runs a band of red, two feet wide, on which are shown six black otters, three on each side, all running from back to front. The females are on the north side and the males on the south side. The white teeth and red mouths are shown, as if half the face had been cut away. The life-line is alternately red and green. The kidneys are green; except for this the animals show black. In front, extending from the ground up on either side of the door and almost to the smoke-hole, three feet wide and rounding off above, is a solid mass of red which represents the rock in the bank where the otters lived. At the back of the smoke-hole, high up, is a green moon with a narrow yellow border, and to the center of the moon is tied the luck-bringing horse-tail. Within the lodge, just above the door, is a rattle made of calf-hoofs with a calf's tail hanging down, to announce the arrival or departure of anyone

entering or leaving the lodge, since whoever goes in or out is quite sure to touch the calf's tail with his head.

The yellow-painted lodge, or the otter lodge, belongs to George Starr, an English-speaking half-breed. It shows at the ground a black band with stars, and on the band rest mountains alternating with cattail rushes. At the front and back are two great red rocks—that at the back with a mink running up either side, that at the front with a weasel running up either side. The ground color of the lodge is yellow. Eight otters, four on either side of the lodge, run from the back to the front. The male otters are on the south side and the females on the north, and the same is true of the minks and the weasels. The otters are very dark brown or black, with red kidneys, and red and blue life-lines. The butterfly cross below the smoke-hole at the back is blue, with a horse-tail attached to it. The top and wings of the lodges are black and show the constellations—the Great Bear on the north side and the Pleiades on the south.

Dan Lone Chief's lodge shows at the base a band of red sky with a single row of stars; mountains rest upon the band. About five feet from the ground, at front and back, are full-faced buffalo-cow heads with the tongues hanging out. Higher up is a fringe of buckskin sewed to the lodge-covering, and on this buckskin as a path, on either side of the lodge, are five ravens walking toward the front of the lodge. Each raven holds in its bill a piece of red flannel representing a bit of flesh. Above, and just below the smoke-hole are three bands, two red and one yellow, which represent sunrise clouds. The black sky (the night) shows about the smoke-hole and on the wings, with the Great Bear on the north wing and the Pleiades on the south. At the back is a blue butterfly cross, and five horse-tails hang down below it.

Short Robe's lodge shows a red band below with a regular double row of puff balls. About two feet above this, and running all around from one side of the door to the other, is a set of double deer-tracks. The hoofs are blue, the dew-claws yellow, and the pasterns red. Above, a long female mule-deer, yellow in color, shows on the north side and a male on the south side. The nostrils, eyes, a round spot in the ear, knees, kidneys, hoofs, hocks, and rump patch are blue; the life-line is red and blue; the coloring in the two animals is the same. Above, near the smoke-hole, are bands, three in all, showing red and white clouds. The Dipper appears on the north wing and the Pleiades on the south wing.

In this lodge-painting among the Blackfeet various sacred objects are commonly represented by certain conventional symbols. Red, white, and blue bands stand for the red morning cloud, the white cloud, and the blue sky; black indicates night; white circles are stars, rather tall cones are mountains, half-ovals are rocks. The pine tree, the cattail rush, and various birds and animals are readily recognizable. Perhaps of all the signs used, the least expressive are the eagle claws seen near the top of Three Bears' lodge.

It is interesting to note that it is the custom of lodge painters always to show the male animal on the south side of the lodge, while the female is placed on the north side. I have been unable to procure from the Indians an explanation of this, but it is almost always the case except in the *In-is'kim* lodges, where the male is on the east or front, and the female on the west or back of the lodge.

Although the Blackfeet give us no reason for placing the female animal on the north and the male on the south side of the lodge, a story told by an allied tribe is suggestive. One of the creation tales of the Cheyenne Indians states that the first people made by the Creator were a man and a woman, and that the woman was placed to the north, and the man to the south, and that the Creator sat between them and talked to them. He told them that where the woman was it should be always cold, but where the man was it would be warm, the grass would be green, and it would never snow. About the man, all through the winter, there would be birds in great numbers, but when spring came they would all spread their wings and fly away to the country where the woman was and would live there until the autumn, when they would again go south to the man's home. This very likely may have some relation to the fructifying power of the sun, which in the spring moved northward, warming the earth, melting the snow, and causing all things to grow.

The symbols by which the different objects are shown are not intricate, but simple. All of them appear to be true copies of nature according to the Indian school of art. It may even be questioned whether they should be called symbols rather than pictures.

The night with its journeying stars is mysterious. The Sun is the most powerful of the gods, and his daily coming the most important event of the Blackfeet's lives. The red cloud which represents his rising, the Thunder-bird standing for the dreaded lightning, the rainbow symbolical of the clearing storm, represent the powers of the Above people.

The powers of the earth are evident in the figures of the prairie and in the mountains, the most impressive features of the earth that the Blackfoot sees, and still more strange and mysterious to him because—true prairie dweller—he never ventures into them nor explores their narrow defiles and dark recesses. Many of the rocks and boulders scattered over the prairie—especially if odd or unusual in shape—possess a sacred character; they are prayed to, and gifts are offered to them.

Certain mountains were prayed to, and a prayer made by an aged Blackfoot to the chief mountain is an impressive example:

"Hear now, you Chief of Mountains, you who stand foremost; listen, I say, to the mourning of the people. Now are the days truly become evil and are not as they were in ancient times. But you know. You have seen the days. Under your fallen garments the years are buried. Then were the days full of joy, for the buffalo covered the prairie, and the people were content. Warm dwellings had they then, soft robes for coverings, and the feasting was without end.

"Hear now, you Mountain Chief. Listen, I say, to the mourning of the people. Their dwellings and their raiment now are made of strange thin stuff, and the long days come and go without the feast, for our buffalo are gone. Useless, indeed, the drum, for who would sing and dance while hunger gnawed within him.

"Like an old blind man your people feel their way along, falling over unseen things, for the gods are angry.

In vain the usual offering to the Sun. Where now the hundred tongues, the snow-white robes which always were his share? And because we cannot find them he turns away his eyes, making our medicine useless. So then we fall and die, even as an old blind man who cannot see the way.

"Hear, now, you who stand among the clouds. Pity, I say, your starving people. Give back those happy days. Cover once more the prairies with our real food that your children may live again. Hear, I say, the prayer of your unhappy people. Bring back those ancient days. Then will our medicine again be strong, then will you be happy and the aged die content."

The animals which inhabit sky and earth and water are potent in various ways, and their help is needed as well. Of all of them the buffalo has the greatest power, but that of the deer and the elk is also great. Birds in general possess power, but the eagle and the raven are especially strong helpers. The Under-water animals are powerful, as shown by the many stories told of them. Of them all the most sacred is the beaver, to which the otter is supposed to be related. The mink is another under-water animal, and the weasel is related to it. The skins of all these *Mustelidae* are extensively used for ornament. The muskrat is also a powerful helper.

The paintings on the lodges represent sacred animals or objects which possess protective power, and the painting was adopted and is continued to insure good fortune. It is analogous to certain acts performed to-day by some sects of the Christian religion, as offerings to patron saints. The paintings thus require no special explanation and need be accounted for by no elaborate theory.

The Trapper's Thanksgiving.

BY EDWARD A. SAMUELS.

"Yes, I reckon old Parson Rogers was right, said Davie Miller, my old-time guide, with whom I was enjoying a two weeks' outing with rod and gun. "He said," continued the guide, and as he threw a couple of logs on the evening campfire that was blazing before our tent, and then returned to his seat beside me on the bed of hemlock boughs, which filled our canvas house with an exquisite fragrance, "that we are all wanting in a proper thankfulness for the mercies and blessings we are all the time receivin'; that we're ungrateful critters to make the best of us. I allow that I'm no wuss nor better than my nabors, and judgin' by myself, the old preacher was right. I know I've grunted and growled when bad luck came my way, and when better things happened along I didn't show a right spirit of thankfulness I should have; we're a poor lot of critters, anyhow, but I'm sartin I felt grateful enough onct, if I never did afore nor since; in fact I've never let my thanks grow dim, though the sarcasm-happened five years ago.

"If you can keep awake a half hour or so, I'll tell you about it, the story is not overlong." And this was the story:

I was trappin' on one or two streams that empty into Long Lake at the upper end, and had two lines of traps each six miles long, good and strong, east and west of my camp, that I had used for several seasons; it was a comfortable log camp, and many's the good pack of fur I've carried away from it. There was a long stretch of sandy beach quite handy to the mouth of the larger stream, and there was an amazin' lot of clams bedded in it; that would be a good spot for muskrats; perhaps you know that the musquash, though it mostly feeds on the roots and herbage of water plants and grasses, it often eats fresh water clams; in fact, the rats kill a big lot of 'em, great beds of the shells being often found on the shore where the clams bed.

Yes, it's a mighty pooty trappin' kentry up there, mink being plentiful, and there was a good sprinklin' of otter, too; and up the west branch there was a beaver pond on a small stream that empties into it, and there was quite a bunch of the critters as I found out to my satisfaction.

I s'pose you've seen a beaver dam and know something of how it's made. I've seen a number of 'em in my time, and I tell you it was hard to believe the critters made 'em. To build one of these dams the beavers begin by felling a good-sized tree across the river, or a large brook, rather; they have picked out a spot for makin' a pond, and they cut the tree down with their big sharp gnawin' teeth as well as I could do it with an ax; they select a shaller part of the stream, and in some way, they know exactly how to gnaw the wood so that the tree will fall exactly right. By jingo! a lumberman couldn't chop it better to have it fall at the proper angle, which is just a little up stream. If there is another tree on the opposite side that can be felled so as to meet it, all the better, they get it there, you can bet; that's the first step. The critters then begin cuttin' sticks of green wood 3 feet or so long and 4 or 5 inches thick. Yes, sometimes nearly a foot thick, and these they drag down to the upper side of the fallen trees, and lay 'em close together lengthwise. Some people say these logs are stood on end; that the beavers stick 'em down into the river bed, but I doubt it. It stands ter reason, much as I give the beaver credit for, that he can't handle those heavy sticks in that way; for my part I don't see how they manage to even drag 'em into the proper place in the dam, from a hundred feet or more away; they must be gosh mighty strong beasts, anyway. When all the logs are packed together just right, they are bound or withed together with limbs of trees which the critters weave among 'em. They are then packed with mud and clay, which the beavers fasten on, using their big, flat tails as trowels, and the whole is weighted down with rocks and pebbles. You can have some idee how hard they keep to work, when I say I've seen dams 300 feet long and 8 feet thick, and as tight as a mill dam.

Oh, yes! They're mighty understandin' critters, and no mistake. Some people wonder why they build their dams; my idee is they do it so they can have a reg'lar height of water all the time. It's not often they build their lodges in a nat'ral pond, because that might rise in a feshet and cover 'em; and so with a river, it might become too strong and sweep 'em away. No,

they prefer small streams or brooks, which can't raise anyway higher than the top of their dam.

Yes, the beaver dam is a mighty tight affair, and in winter it freezes as hard as stone.

In their pond they lay up a big stock of logs for provender, cords of 'em are cut down and carried near their lodges, and their grub is ready for 'em any time all winter long. Oh, yes, they've got big heads, the beavers have for sartin. The critters are gettin' pooty skarce, I'm sorry to say, for their pelts are allers sartin to fetch a good price, and the meat is good eatin', too; the Injuns eat the entire animal, but I don't care for anything but the hind quarters, which are as good as the best lamb you ever tasted; in fact, I doubt if you could tell it from lamb, if put before you at the table. As for the tail, when it's nicely stewed, it makes the richest dish ever eaten; there's nothin' th' ever compares with it, unless it's a moose's muffle, which, when stewed, is very much like it in flavor and richness. But that's neither here nor there, and nothin' to do with my story. As I said afore, I had two lines of traps, each six miles, good and strong, and I tended 'em one day, and the other the next, and I'll tell you I had to hustle to take off the pelts, get back to camp and stretch 'em and git supper afore dark.

Well, I had a pretty good catch and I felt rich, for furs were bringin' a good price then. I had been out nearly the four weeks that I had planned to put in, and three days afore Thanksgiving I made my last rounds, takin' up my traps and bringin' 'em into camp. Of course I might have done well to put in a couple of weeks more, but I wanted to be home on Thanksgiving sartin.

Well, on the last trip to camp I had a pooty middlin' heavy pack, and as I had my rifle along, I thought, seein' I was so well loaded, I'd cut across a stretch of barrens to save a couple of miles, there bein' an old loggin' road most of the way. I had hardly got out of the heavy growth and started in on the path when I saw two animals movin' about fifty rods or so in the open; they were a couple of moose, one of 'em a big bull with a rousin' set of horns, and the other a two-year-old bull with nothin' on his head to brag on. You may be sartin it didn't take me long to drop my pack and begin to stalk 'em. As you very well know, a moose or caribou is hard to stalk in the open barren, 'specially when there's no scrub firs or pines to get behind, but luck was with me, the wind was blowin' from them to'ard me, and I wormed and crawled along until I got in good shootin' distance.

I had one of the old-fashioned breechloading cavalry carbines that threw a pooty heavy bullet mighty spiteful, and if it hit a moose right it knock him over, sartin.

Well, I got up on my knees, took off my hat and laid it on the ground beside me, and put my cartridges on it. I had only five of 'em left and couldn't afford to lose or waste any. I got a good bead on the big one, aimin' just behind the fore shoulder, and pulled. The smoke was hardly out of the gun afore I had another cartridge in and its bullet flyin' at the other moose. I then got a third cartridge into the breech and jumped up. The big moose was lying on the ground about done for, but the other was tryin' to hobble away on three legs, the off fore shoulder havin' been smashed. I gave him a quartering shot along the back and he dropped.

Well, I had my hands full for sartin, two moose and my pack and nearly a mile from camp, and only three or four hours of daylight left. I dressed the critters in first class shape, for they both were in good condition and well worth carryin' home, and by riggin' a couple of poles as a sort of sledge, got both to camp afore dark, but I was about beat out, I'll tell you.

That was on Monday, and I planned to be home on Thursday, which was Thanksgiving day. I had two days left, and I had no doubt I could do it easy if I could continue to git all my dunnage down the lake in one trip. I had a good-sized row boat along, big enough to carry four men and my pack, and my canoe, but both of 'em couldn't hold traps, furs, camp outfit and the moose. I lay awake awhile that night until I thought out a good plan, and next morning I was up at daybreak and makin' a raft of logs at the shore of the lake, a few sticks havin' been left there by lumbermen or drifted there during high water. It was quite a good, strong affair, and I knew it would carry the moose and anything I wanted to put on it, and I had no doubt I could tow it with the boat, provided the wind was fair.

It took me till Tuesday noon to git the raft ready and the moose loaded on it, and I had the rest of the day to pack up my odds and ends and git everything ready to start early the next mornin'.

About 2 o'clock I thought I'd take my rifle and cruise around a little. You know how it is when we're in the woods, we always want one last day's cruise afore we leave, and I had mine and no mistake, and I shall never forgit it, for it was the worst scrape I ever got into, and no mistake.

I forgot to say there had been a light snow fall in the night, not more than an inch or so, but it was enough to last all day, anyhow. It was a good trackin' snow, and I started out with my rifle and two remaining cartridges in search of somethin' in the way of game to top off with. I had gone hardly half a mile afore I saw the tracks of a bear; they were the biggest tracks I ever saw, and I knew the critter was a whopper.

Now, I daresay you know that even when you see the tracks of a bear it is not allers easy to foller 'em up, for the critter is a mighty cute beast, and knows a thing or two about hidin' his trail. I was keen to foller him, for I knew those big tracks meant somethin' good. To throw off anyone who is follerin' his tracks the bear goes through all sorts of maneuvers; it is a common thing for him to travel back over his trail, and when he comes to a windfall he'll walk along on that as far as he can and then jump off at one side, and you'd hardly think it possible for the beast to take such long leaps as he does.

No, the bear never takes a bee line for his den, the natur' of the beast being a cautious, wary one. As I said afore, the tracks of my bear were so large I knew

he was a lunker, and I was bound to git him, if I could.

The general direction of his tracks pinto to a rocky hill nearby, and I started for the spot where I thought the den was without wantin' to foller his tracks all the way, and sure enough, as soon as I got to the ledge I found his foot prints, and they led into a hole in the rocks, and there I knew the critter's den was located. I got down on my hands and knees and crawled into the entrance of the cave, pushing a pole ahead of me to use in feelin' around for the bear. It was not long before I found the old chap, and he was so sound asleep my pokin' did not wake him up. You know that when a bear really dens he is so stupid you'd believe him dead. Well, I felt around and located the lay of the different parts, and pointing my rifle at what I thought was his head, I fired one of my two remainin' cartridges at him and slipped the last one into the breech of the rifle so as to be prepared for him in case he made a dash out. But he didn't come, and after a while I crawled into the cave agin and listened; the critter was evidently hurt pooty bad, for I could hear him sort er kickin', and every now and then he'd give a wheezy cough. Pooty soon he grew more quiet, and then all was still, and I knew he was done for. To make sure, however, I poked him two or three times with the pole, but he never moved.

The next thing to be done was to get him out, and to do this I cut a stronger pole, and trailing it along I crawled back into the den, planning to fasten a piece of rope around the critter's head, tie that to the pole and then back out of the cave, hauling him out.

The den grew smaller as I crawled further in, and there was a bad corner in it and two or three sharp points of rocks on the sides; but I managed, after pushin' pooty hard, to git in as far as the bear was lyin', and to tie a noose around his head and fasten it to the pole.

I then started to back out, but soon found I couldn't move a foot, fer somethin' was holdin' me there. I tried my best to crawl backward, but could not, and the harder I struggled the harder I was held.

I'm afraid I got a little rattled just then, for if I had had all my wits about me I could have got away all right. It was a pokerish hole to be in, and p'raps it's no wonder I got rattled. The thing that held me was a stiff root that had grown down inter the cave and somehow got broken off; it was not much thicker than my thumb, but it was strong and tough enough to stand all my strength. When I passed it in crawlin' in it slid along my back without my noticin' it, but when I began to back out it passed under my belt and held me, and the harder I tried to pull back the pesky thing clung more steadily, and before I knew it my belt was dragged up almost to my armpits, and then I was helpless.

I tell you I began to git good and skairt. I knew I might die there, and probably would, and no one could ever find me; I was, as it were, buried alive.

I have heard that when a man is drownin' all the evil events of his life pass through his mind like lightnin', and 'twas the same with me. I don't think I've been over bad, but there was two or three things I had done in times past that I would er been glad ter take back. I had onct or twict sold some mighty poor pelts for prime ones, by slippin' 'em inter a lot that had been passed upon by the buyer and takin' full pay for 'em. I was mighty sorry then, and prayed ter be forgiven.

Somebody said that, "When the devil was sick, the devil a monk would be, but when he got well the devil a monk was he." I remembered that very well, and promised if I ever got out of that I'd not act like the devil, but I'd keep a straight path forever after.

Agin and agin I tried ter git away, but the root held like a vise, and pooty soon my strength gave out and I grew sort er faint, and had a kind of nightmare and saw all sorts of hateful things; it seemed ter me, too, that the bear had come ter life agin and was beginnin' to gnaw my back and neck. I s'pose I wasn't there over a half an hour, but it seemed like eternity. At last I came out er my faintin' spell and began ter think, and all at once my wits came ter me, and I called myself a thunderin' fool not to think of the belt buckle that was drawn up on my chest. I could reach that, easy, unclasp it and git free. I almost yelled when I unfastened the buckle and backed out of ther hole, and when I saw the blue sky and bright sun, and bréathed the pure air agin, I was a mighty happy man.

After takin' a short rest and smoke to stiddy my nerves, I went inter the hole agin, got my belt, pulled out the bear and dressed it, savin' the hams and skin, and after gittin' my bearins' packed them back to camp.

Well, the story's about done. I put in a big sleep that night, and after eatin' a hearty breakfast I shut up the camp for the winter, loaded all my dunnage on the raft and in ther boat, and hitchin' it to ther raft I took my oars and began my tow down Long Lake. I had a pooty precious freight, as you can see, when I tell yer I got \$25 for the big moose head, and for the meat and hides I got \$20 more; the bear skin and bounty netted me another \$20, and fer my furs I received about \$150, which I allow was pooty good pay for four weeks' work.

Well, fortunately, I had a fair wind down the lake, and my pull was not an extra hard one, and I reached the landin' at the lower end about noon.

I had planned to have my boy meet me there with ther team, and sure enough, just as I stepped on shore he came in sight.

The next day was Thanksgivin', and my wife just laid herself out to get up a big dinner, for we had the preacher to dine with us. We had a nice pair of chickens, a rousin' big stew of moose meat muffle, some moose steak, a plum puddin' and mince and punkin pies, and when the parson said grace and asked a blessin' on us and prayed that we might be grateful and thankful for all the good things that came to us, and fer our health and preservation from sickness and death, I can tell yer, I said way down in my heart when he had finished, Amen! Amen! Amen!

The Red Gods, Adieu.

It may here be worth our while to examine how it comes to pass that several readers who are all acquainted with the same language, and know the meaning of the words they read, should nevertheless have a different relish of the same descriptions. We find one transported with a passage which another runs over with coldness and indifference; or finding the representation extremely natural, where another can perceive nothing of likeness or conformity.—Joseph Addison in the Spectator for June 27, 1712.

Editor Forest and Stream:

Not as an ancient doer of deeds of woodland derring-do, and not as a blind worshipper of Kipling, but in simple justice to what seems to me straightforward enough poetry, I want to take a shot at the latest "Amusings from Sand Lake" before you, very properly, forbid further reference to the Red Gods.

Mr. Brown is evidently not in sympathy with poetry, however much he would have us think so from his references to nature poets, which references carry him as far afield as Mr. Ashcroft wanted to go in search of men who have never seen a shod canoe-pole, until Mr. Brown wisely called him off. I say this because he approaches Kipling's poem with carpenter's rule and square, and accuses the poem because those implements do not fit. Thus, because the verse asks, "Do you know the blackened timber?" he asserts that "blackened timber" is chosen as the ideal camping site! Why? Who was talking about camping sites? The racing stream is mentioned in the same line: why not with equal propriety say that that was chosen as the camping site and that Kipling intended to place the couch of new pulled hemlock in the middle of a brook? The lines mention two or three things which one may see in an hour's canoeing in the woods—a bit of burnt land, a racing stream, a shingle bar, a log-jam—and add "it is there that we are going," namely, to the place where all these things may be seen—to the woods.

Again, the words "Do you know the blackened timber?" are simple enough. Mr. Brown finds in them "cheap mystery," "mention of something he (Kipling) knows the reader cannot be supposed to know because it is not located," etc. This is the very lunacy of criticism. May I not recognize the reference without knowing exactly what township the blackened timber is in, or what stream it is on?

Again, he says that no log-jam is ever at the end of a racing stream. All right, if we must put our rule on that stream and find out just where the jam is, why not say it is at the end of the race in the stream—i. e., at the foot of the rapids? Nobody need be wrenched by that construction—no poetry is offended at such license.

Again, must a "right-angled" log-jam be one whose "upper line lies straight and squarely across the stream and forms a right angle sharply with each shore?" Why not say that a jam which sticks out into a stream, or sticks up from it, or whose logs lie crossed in all directions, is a right-angled jam? This is poetry we are dealing with, not geometry or carpentry.

And when Mr. Brown, losing that calmness with which he started off to tell us all about himself in heart to heart fashion, declares that Kipling sets himself up as a "Sir Oracle" of the woods, "a high priest of nature at whose feet all sportsmen should sit in admiration," and reduces the fine lines to "a bar of rough stone to sit on, blackened timber for a view, and a Limburger Indian to make a couch," etc., one can only say that this is the criticism and the rendering of poetry by a Bottom, the weaver, or a Snug, the joiner.

Let us try a little criticism in Mr. Brown's own vein, taking at random some lines from a not unknown poet:

"The barge she sat in, like a burnished throne,
Burned on the water; the poop was beaten gold;
Purple the sails, and so perfumed that
The winds were love-sick with them; the oars were silver,
Which to the tune of flutes kept stroke, and made
The water which they beat to follow faster
As amorous of their strokes."

Mr. Brown would ask why, if the barge burned, Cleopatra did not order her slaves to extinguish it. He would point out that a golden poop would bring the bow high out of water, and that silver oars would weigh so much that ten men could not handle them, even if inspired by the tootling of flutes. He would speculate on how many bottles of cologne it would require to perfume the sails, and would show that, while water may follow a boat, it would not follow the beat of an oar, but, on the contrary, would flow away from it. On the whole, he would conclude that Enobarbus was a plain fakir, who was setting himself up as a Sir Oracle to the confiding Mecenas and Agrippa.

Alas! poor Kipling! "Writer of swashbuckler rhymes," the "literary hack" who "planned a 'grand' poem which the Maine folk should accept as coming from a new Elijah!" All this lamentable showing of you up would have been avoided if you had not neglected to mention that the most prominent feature of the woods was once the pervading presence of an ancient *coureur des bois*, since, unfortunately, retired to Sand Lake, Mich.

E. G. B.

NEW YORK, NOV. 22.

Editor Forest and Stream:

I am vastly interested in the Kipling controversy. I think it is the most interesting set of articles I ever read. Not only are they highly instructive and entertaining to all lovers of nature, but they are valuable as being indicative of the various and opposite standpoints that ordinary intelligent men take in matters of the most ordinary and everyday concern. I think really that the anti-Kiplingites have been unfortunate in their champions and their weapons. The last to enter the lists, Mr. E. P. Jaques, is a good specimen. He virtually admits that the poem is right enough, or, as he puts it, two of the chief points of discussion "seem sane enough." But he gives himself away when he says: "When any of my friends get de-

lirious over Kipling, I accuse them of playing the grand stand." Now, it is not Kipling we are discussing, but the fidelity and accuracy of a certain word painting of which Kipling happens to be the artist. I am sure if the singer had been named A. W. Ashcroft, or L. F. Brown, or even E. P. Jaques, instead of Rudyard Kipling, and his song had been so harshly and unjustly criticised, these very same gentlemen, Messrs. Manly Hardy, the Old Angler, Ames, the Hermit, Von W., Dixmont, R. T. Morris, E. P. Biddle, Otto Keim, and others, would have arisen as one man and done what they have deemed it incumbent on them to do in the present instance. It is evident that Messrs. Jaques & Co. have a personal prejudice against Kipling, and like their forbears they persuade themselves that nothing good can come out of Nazareth. Mr. Jaques, like his confreres, gets in his little sneer at "these able defenders of Kipling," and asks three or four questions that have been answered over and over again. Then he insinuates that there has been "a mutual understanding" between those who criticise Mr. Brown's unhappy, inaccurate, and distorted criticism of Kipling's poem.

The contributions of the dear Old Angler, Mr. Hardy, and the other gentlemen who so ably and strenuously championed this masterpiece of Kipling's, show them to be kindly, gentle men, true lovers of nature, intelligent enough to recognize a good thing when they see it, and brave and courageous enough to meet and defeat opponents who suffer from defective vision, disordered liver, or, worse than all, vindictive jealousy.

As to the "mutual understanding" between the defenders of Kipling's beautiful word-picture which Mr. Jaques refers to, I think this is the highest tribute yet paid to it. That so many different men, of various ages, nationalities and temperaments, from so many diverse parts of the United States, Canada and Newfoundland, should be so unanimous in their expressions of approval of the fidelity of Kipling's lines as to make Mr. Jaques think that there is collusion among them, is the very best proof that could be adduced that those lines are all right, and that they strike lovers of nature the world over as being a beautiful and truthful description of everyday scenes, visible to the eyes of all men, but given only to the very, very few to be able to describe them so truthfully and graphically as they are described by Mr. Rudyard Kipling in the lines under discussion.

ST. JOHNS, NEWFOUNDLAND.

NEWFOUNDLANDER.

NEW YORK, NOV. 18.—*Editor Forest and Stream:* Last night a party of us, old salmon fishermen, having gotten together, the subject of the article—"Kipling's Red Gods" published in FOREST AND STREAM, October 17—was canvassed pretty thoroughly, and brought forth so many pearls of derision and laughter, that I was asked to try and answer it; which I will endeavor to do herewith.

Mr. Ashcroft commences by a criticism of Mr. Hardy's defense, and reproduces some lines by Kipling:

"Do you know the blackened timber? Do you know that racing stream,
With the raw, right-angled log-jam at the end?"

Now, as I am a lumberman with about thirty-five years' experience, it can fairly be said that I ought to know something about "blackened timber, racing streams, and log-jams." It is only necessary to go into almost any of the timber districts to see "blackened timber" caused by forest fires.

The "racing streams" are those down which the logs are brought, and they are not "tree trunks," either, for saw logs are cut to 12, 14 and 16 feet lengths, and sawed off square at each end.

As to the "log-jam" part of the affair, it is almost ridiculous to have to explain that a "log-jam" almost invariably occurs either at the head of a sand bar or shallow place, or in a gorge in the stream through which the current passes with force. As soon as the jam commences the great strength of the current forces the logs in all sorts of positions, and they pile up and entangle themselves in every direction, invariably they there form an almost solid barrier across the surface of the stream. Then the other logs, as the current lessens and the water deepens up stream, begin to accumulate, and do so for long distances, but, unless the current is very heavy, the logs lie quietly and do not up end or become entangled in the manner that they do at the down river end of the jam. I have ridden for miles and miles along the "log-jams" of the streams in Michigan and elsewhere filled with logs from bank to bank, so that no water whatever could be seen. Therefore Mr. Kipling is correct as to "the blackened timber and the right-angled log-jam." As to the "Bar of sun-warmed shingle, where a man can bask and dream,"

everybody knows that there are bars and sand banks in almost every river, and when the sun shines on the sand it becomes warm, and if anybody wants to go and lie down there with the sun shining on him, he will find it a pretty good basking place, very often too hot for comfort. As to the

"Click of shod canoe-poles 'round the bend,"

as Mr. Ashcroft gives a considerable discussion to this matter, I will do the same, and it is quite evident that the man that he speaks of "who has camped and slept under canoes for weeks during half the summers for the last forty years," has been "jolly" him up not a little. I fished that great salmon river, the Grand Cascapedia River, in Quebec, for twelve years, and many other rivers in subsequent years, and every day of my life both my companions and myself were poled up the river, some times for many miles, in separate canoes, of course, and the "click of the shod poles" certainly was very much in evidence, and many's the time that when standing quietly in the canoe casting for salmon and the wind blowing up the river, yes! many a time, have I heard the "click of the shod poles coming around the bend," even though that bend be one-eighth of a mile or more distant.

As to the matter of "canoe-poles" used for shoving canoes up quick waters, Mr. Ashcroft's, or his friend's, assertion that they "are made of ash or maple and usually twelve or fourteen feet long, and about one inch in diameter at each end, and a little larger in the middle," is almost too ridiculous for criticism. It does not make any difference as to whether the poles are made of maple,

ash, or any other wood, poles of that diameter would quickly break in two, whereat the man who was poling would find himself taking a headlong plunge into the river and the canoe probably capsized. The poles that are used on the rivers above named and everywhere else that I have been, are made of almost any kind of handy wood (spruce preferred because of its lightness and stiffness), and are never longer than about eight feet, and usually about two inches and upward in diameter; any smaller sized poles than this would be dangerous to use, for even poles of the above size not infrequently break in two by the great pressure that is put upon them in poling a loaded canoe up a heavy rapid.

Now comes the item of "shoeing" the ends of the poles. This is always done either with iron or steel about three inches long and brought down to a dull point of say one-fourth of an inch, or three-eighths of an inch in diameter; to use unshod poles would be dangerous in the extreme, for the ends of them would "brush up" whether surrounded with an iron ring an inch or two back from the end or not. The rocks in all those salmon rivers are largely round and smooth, and extremely slippery, and to attempt to pole a canoe in heavy waters with an unshod pole would be something that no guide would dare to do, for he would know that in a very few minutes the end of the pole would slip off some smooth, round rock which would cause disaster to both himself and the canoe. If Mr. Ashcroft and his friend have never seen a "shod canoe-pole," and "doubt as to whether they will ever see one outside of a museum," I would suggest that the next time they are in Canada they stop off at the Restigouche Club at Metapedia Station, Quebec, or pay a visit to the Grand Cascapedia River thirty miles distant, or to the Bonaventure River, or any of the rivers flowing into the Bay of Chaleur or any other salmon river in Quebec, and they will see plenty of canoe-poles with iron shod ends, as above described; in fact, they will see no other kind.

As to the "couch" and "the new pulled hemlock, and the starlight in our faces," well, if a man is sleeping in a tent in the woods, or in a shack, and he hasn't got any mattress with him, the first thing the guide who knows his business does, is to go out into the woods and bring into the tent armful after armful of short branches, no more than a foot or so long, stripped from hemlock and spruce trees that are near by; he does this until he gets a pile of them about a foot deep, and the delightful odor from these woods is certainly conducive to sleep. Of course, if a man is sleeping in a tent, or cabin, or a shack, he can't very well have "the starlight in his face," but if he is sleeping in a lean-to and the night is clear, he will certainly have "the starlight in his face," and the moonlight, too, and every old light that comes in on the open side of the lean-to, and if the sportsman is a sportsman he will not attempt to angle for trout or salmon at night, for it is against the law to do so in Quebec, and in almost every other fishing country that I know of. And he wouldn't catch anything at night any way.

It is a very remarkable fact how many men there are who call themselves sportsmen and pretend to have great knowledge and experience in various matters pertaining to fishing and shooting, who rush into print when they really know nothing about what they are writing. Only a few days ago I saw in one of the illustrated magazines an article on rail bird shooting, with a picture of two men sitting on the ground with a lot of snipe decoys around them. Every sportsman knows that the rail bird is a bird that inhabits marshes, and that never shows himself at all until he is stirred up by a boat which is pushed over the marshes when the tide is high enough to do so, then the rail bird takes flight, and only then is he usually visible. As to coming to a decoy or anything of that sort, such a thing was never heard of so far as a rail bird is concerned, and yet there was a reputable magazine that not only published such a ridiculous thing, but attempted to picture it also. It is not often that I bother myself in correcting such foolishness, but in this instance I think that the readers of FOREST AND STREAM ought to know the real facts, and hence this article.

ROBERT C. LOWRY.

MONTREAL, P. Q., Nov. 19.—*Editor Forest and Stream:* What a tempest in a teacup has been raised over Kipling's "The Feet of the Young Men."

Truly, each and every man is entitled to his own views—be they broad or narrow; but how criticism such as that of Mr. L. F. Brown's can be evoked, is beyond ordinary comprehension. Has he ever heard of such a thing as "poetic license?" Yes, surely, because he gives us a photo entitled, "Leaving a Camp—A Last Look at the Slagle River," and underneath are inscribed the words, "Good-by, Sweetheart! Good-by!"

Now, were we to adopt the line of criticism used by Mr. Brown, we would promptly say, that a stream has no heart—ergo it cannot be sweet, while being an inanimate object, it is foolishness personified to even address it. However, the pratable explanation is, that these magnificent (in the sense of conveying that indescribable charm that lies in a picture mirrored by words) lines of Kipling, must have fallen under this critic's notice when he was suffering from liver, and consequently disposed to be captious.

In a man who has seen as much of the wilderness as Mr. Brown—and his friends tell us he has—it is all the more remarkable; but whether he knows it or not, the "Red Gods" have called him, and he has answered their call!

A stream, silent and swift, and having good trout fishing, may yet "race." One is not called upon to pit it in contest with any other stream—it runs; poetically, it races.

When one is lying basking in the sun on a pebbly bar, the end of the stream, so far as vision is concerned—which is all that is meant by Kipling—is as far as you can see water, and no further. "Shingle" may not be pebble, but does it not convey to the mind what is meant?

The angle of the "log-jam" would depend entirely on one's position and which way he was looking at it.

"Raw," applied to it, means something out of harmony with the other surroundings.

A canoe-pole with ferrules on the ends—call them sleeves if you will—will click when the metal strikes a stone, the noise being conducted and imparted to the

surrounding air by the wood of the pole itself.

So far as "smoky" is concerned, I often in the winter evenings have pulled my favorite rifle from its case just to sniff that very odor of smoke, and by it recall many pleasant bygone camping scenes and pleasures. When we come from a day's fishing—if we have had good luck—we smell decidedly *fishy*; and on a shooting or camping trip, we smell *smoky*. How, then, about the Indian, who is about open fires more or less all his life? As to his silence, he has his fits of talkativeness and his supply of fun; but, as a rule, he is shy and silent. Talk to him, and he will talk; laugh with him, and he will laugh; but remain silent and how often will he be the one to break it, other than to call your attention to something in or of the woods or waters you are passing through?

Anyway, to those of us who love the life of which these few lines of Kipling's are so descriptive, whose blood tingles in sympathy, and who can see the whole scene so much more vividly portrayed than that of the commonplace little photo, under which are the words "Good-by, Sweetheart! Good-by," we will read and re-read with a pleasure bordering in its intensity almost on pain.

It is easy to criticize! But give us something better than Kipling's, Mr. Brown, give us something better!

ALERT.

Editor Forest and Stream:

In your recent issues I have come into collision, or, as I may say, into communion, with the critical observations of your many contributors who tamper with musical Mr. Rudyard Kipling's

"Do you know the blackened timber? Do you know the racing stream,

With the raw, right-angled log-jam at the end?"—

and noting that Mr. L. F. Brown, who has given us some good things in FOREST AND STREAM, was receiving a rather variegated lot of tributes for a recklessly thrown brick or two, I looked up the back numbers of this journal and started in where Mr. Brown flushed—

Do you know the blackened timber? Do you know the racing stream,

With the raw, right-angled jog-lam at the end?

and who then threw bricks and other hardware, including dead cats and a few other gimcracks, together with a boomerang or two.

I shall say nothing radical either way as to merits of red gods, nor blue screeds—let the critics crucify themselves. Let 'em go it, but

I know the blackened timber! And I know that racing theme,

With the raw, right-angled dog-ham at the end,

is making me nervous.

After reading up back numbers, I thought I missed some of the essential rhythm, or whatever it is, of the lines—

Do you know the blackened ember? Have you got the frisky scheme,

With the raw, ram-spangled saw-log at the end?

I commenced again at the beginning, giving the whole subject a fair chance to deploy in review before one of the clearest intellects in this sparsely settled part of the world.

Mr. Brown's observations now seemed to me to be eccentric, but quite rational, until he takes up the lines beginning:

Do you know the blackened limber? Do you know the chasing scream,

With the raw, ding-dangled jim-jam at the end?

and there I again lost the finer fancies of both the subject and the predicate.

Mr. Hardy, who seems to have taken the popular, possibly the right, view, and who presents tangible, if not authentic, evidence, in the shape of photographs, next employed my mental equipment enduringly until he, too, observes—

Do you know the hackened timber? Do you know the bracing steam?

With the raw, new-fangled flim-flam round the bend?

and then in spite of my constitutional aplomb, or whatever it is, I began to go groggy.

Resolving, nevertheless, to be not entirely laid away by a nursery jingle by Kipling or any other foreigner, and believing I could cope with any couplet that will hold still on paper, I stayed with the outfit until the general round-up. One after another correspondent writes—

Do you know the slackened limber? Do you know the lacing jeem,

With the raw, ran-tangled schie-dam at the wind?

or words to that effect, as lawyers have said, and I left off, for the immediate present. I was not baffled nor discouraged—not by a long shot. I rested my case until I could attempt sleep, as it was after hours.

I think I slept briefly, and then I found myself awake, telling my wife—

"You have seen the cracking thunder! You have had the raking squeem,

In the raw, ding-dangled doo-dad of the fiend!"

Nothing in the world but a woman can relieve a man's mind of such a burden. She did it by relieving her own in expressing a few things that neither reasoned, rhymed nor rhythmized, but I was glad to forget everything but the golden quality of silence, and the obscurity of snoreful pretense, the next best thing to real sleep.

RANSACKER.

CHARLESTOWN, N. H., Nov. 20.—*Editor Forest and Stream:* I am glad to see that you will close the "Kipling controversy" with the current number of FOREST AND STREAM, and though I had not intended to say anything more on the question, the long and somewhat irrelevant diatribe of Mr. Brown in this week's number impels me to add a few words to it. In the first place, four of us, all octogenarians, or nearly so, Mr. Venning, Mr. Hardy, Hermit, and myself, have certified to our own positive knowledge to Mr. Kipling's exact and correct description of the facts as they exist in the New England States

and the northeastern Provinces of Great Britain. I do not know the age of Mr. Brown, but we were probably all familiar with the woods before he was born, and know as much about "blackened forests," "raw log-jams," "shingle bars," and "setting poles," as any camp proprietor in Maine whom he can quote for authority.

In the second place, I merely wish to remind him of the old adage that "Those who live in glass houses should not throw stones." His own pleasant verses in FOREST AND STREAM two weeks since are as open to criticism, when it comes to matter of fact, as any lines of Mr. Kipling.

"Springs with pearly basins strewn with pure white shells" are as scarce in the Northern States or Canada as "roc's eggs," though they may exist in Florida.

"Mossy banks" are not usually "flower strewn," for flowers do not often grow in moss, and the "ferns" which flourish around the springs are not of the same species as those which grow on the "surrounding hills!"

So much for simple matter of fact. I do not propose to find fault with Mr. Brown's verses, but he should allow as much "poetic license" to other writers as he takes for himself, and I think we have sufficient proof that, from his standpoint, Mr. Kipling took no license at all! Now, all this is with the kindest feeling toward Mr. Brown, and a renewed assurance of my appreciation of his previous writings, and a hope that he may continue them, but rather to describe his own experiences and sensations than to criticize and carp at those of others!

VON W.

Editor Forest and Stream:

A FEW days ago I rode for many miles along the upper Hudson. I saw thousands and tens of thousands of logs jammed in the river bed. Were they lying parallel to the course of the stream? No, indeed! Probably 99 out of every 100 were lying at right angles to this course. The reason is obvious. It would be as easy to stand eggs on end as to cause logs to jam end on in the current. When a floating log strikes an obstruction end on, the upper end swings one way or the other, and the log is either carried over or lodges at right angles to the current. Was Kipling accurate or inaccurate?

Once more, I hunted last season on the Little Tobique with Adam Moore, one of the ablest and most sportsman-like of the New Brunswick guides. I saw no canoe poles that were not "shod," and if a pole be broken the tip is removed to be fixed upon another pole. More than once I heard the click of the pole before the canoeist wielding it came in sight. There is little opportunity to hunt when poling through swift water, but in still water the pole is laid aside, and the paddle propels the canoe noiselessly along. I maintain that Kipling was not in this instance inaccurate.

It seems to me that Mr. Brown, starting in prejudice, has, in the heat of argument, reached the utmost extreme of hyper-criticism, and has taken a position which in calmer moments he will regret.

No candid man can deny the frequent brutality and even vulgarity in Kipling's writings, but he is ever far removed from the commonplace. The verse under discussion seems to be true, striking, and vivid, and to have strength which is not found in the other selections quoted by Mr. Brown.

M. F. WESTOVER.

WHITINSVILLE, Mass., Nov. 20.—*Editor Forest and Stream:* I feel that I would like to be recorded for the Red Gods. I think that Kipling's lines express precisely the condition of things as they are found in the deep woods of Maine. It is marvelous that so much thought can be expressed in so few words.

Just a word in regard to "blackened timber." To me this means the evergreen forest of spruce, fir, and pines—particularly spruce. This class of trees is generally referred to in the section of Maine that I visit as *black growth*. I know of a Black Nubble and a Black Mountain that I believe to be so named on account of the heavy growth of spruce trees on each. Also this black growth, in my experience, usually covers the banks of the rivers—particularly the quick running ones for a considerable distance from the water.

C. A. TAFT.

PELHAM MANOR, N. Y., Nov. 24.—*Editor Forest and Stream:* Those who believe Kipling's lines describe "universal" conditions, and those who are interested in the matter, are invited to write to such master canoeists as Brewster Brothers, of Field, British Columbia, or Mr. L. O. Armstrong, of the Canadian Pacific Railway, who presented "Hiawatha" at the Sportsman's Show last March; and they will learn that shod canoe-poles are not used, and their use is confined to canoes around log-drivers' camps. Mr. Armstrong, as I am told, never saw a canoe-pole in use that was shod; and he has traveled that way thousands of miles.

F. J. HOYLE.

BLUE POINT, Long Island.—*Editor Forest and Stream:* Fred puts it pretty good; he was satisfied to accept Rudyard and his "blackened timber," shod poles and all that but for Brown. Then someone else put him right and he straightway returned to his old love. All was well; Rudyard could have cooked the raw log-jam to a crisp; we were all asleep, lulled by the melodious click of shod poles, and were entirely satisfied to dream under the mystic influence of the lute, and "the strange weird carrying quality"—but for Brown! Brown's right! But I wouldn't have Kipling alter one word of the Red Gods for worlds.

CAP. WILL GRAHAM.

CANTON, Pa.—*Editor Forest and Stream:* There is an old saying that everybody knows how to edit a paper, doctor a sick horse, or preach a sermon, but at the risk of having this quoted to me, I am going to make a suggestion which I am sure will meet the approval of a very large part of FOREST AND STREAM readers. If there is to be any more written about Kipling's "Red Gods," cannot you have it printed in a supplement so that those of us who are deadly tired of it can put it in the fire at once on arrival and not spoil the rest of the paper, which we love to read? I don't know Brother Brown, but I am sure he is a good fellow from the way he closes his letter, and if he will come out here I will promise to sit down with him to a broiled grouse and other good things.

Why can't the fellows who differ about Kipling's ability as a poet get together and settle their differences in some quiet spot and give the other fellows a much needed rest?

J. W. PARSONS.

BUFFALO, New York.—*Editor Forest and Stream:* To fully appreciate Kipling's poem one must be acquainted with the scenes he is describing when these pen pictures become vividly real. I was born in Maine and to me the poem is a masterpiece and accurate in detail. I read and re-read the contributions of The Old Angler, Manly Hardy, and other able writers. They brought me back to the old scenes. Kipling does not mean that the Red Gods are actual, live, real Red Gods, but to him whose affinity is in the wilderness, they are real enough, and I often hear them calling—not only calling, but almost pulling me to the forest I love so well.

DIXMONT.

DURHAM, Kansas.—*Editor Forest and Stream:* In your issue of November 14, Hermit says, in regard to my letter of the 7th: "Your correspondent, E. P. Jaques wants five questions answered by the able defenders of Kipling." He wants the answers to agree. The questions have been answered by several correspondents, and the answers have agreed, except in minor points.

Now, for fear there may be some who have not followed the contest closely, I will submit a few of these replies which Hermit says agree. As explained by the FOREST AND STREAM commentators, Kipling meant by Red Gods "red salmon" (Hermit); "red gods of desire" (Kenneth Fowler); "pompous poetic license" (Ashcroft). Raw log-jam means "a raw thing in the landscape" (Old Angler); "logs stripped of bark" (Charles Cristadoro); "raw, as not altered from the natural state" (M. Hardy); "superlative degree of rough" (Hermit).

Right-angled log-jam means "jam at right angle to the stream" (Hermit); "tendency to rear up at right angles" (Hardy); "right-angled at every possible angle" (Von W.).

These are only samples of the answers which Hermit says "agree."

Mr. C. H. Ames quotes from Shakespeare to show that meaningless language is all right in good description, but I would say to Mr. Ames that "to take arms against a sea of trouble" is very apt metaphor, and cannot be interpreted a half dozen ways by its best friends. Good description carries a picture that looks alike to all observers, yet these eight Kipling lines of the "best description ever written" appears different to each on-looker. I hold from this that Mr. Brown is vindicated. Most people will remember the lines of poetry that got entangled in Mark Twain's head until he could think, talk, or dream of nothing else:

Punch, brothers, punch with care;
Punch in the presence of the passenjar.

I am afflicted in the same way by these Kipling lines.
E. P. JAQUES.

Editor Forest and Stream:

I have taken no part in the Red God and log-jam controversy (*cheu jam satis*), though I have been quoted as authority on some points; but now that you have put a time limit to the wrangle, permit me space to congratulate Mr. Brown upon his masterly climax in your last issue, and the *bonhomie* with which he lifts his "stein" of Brown stout to the health of all concerned—Kipling possibly excepted.

Mr. Brown has well expressed the exhilarating charms of the western mountain ranges, in comparison with which the Maine forests are stuffy and tame. Nevertheless, I thank Mr. Kipling for his stirring poem whose lines, so happily phrased, present the most striking features of the Maine environment; for I shall never again think of the Pine Tree State without recalling the blackened timber, the racing stream, the canoe-pole, the log-jam, and the smoky Indian—and the discussion that went with them! As to Mr. Brown's literary criticism, which I dare say is just enough, he seems to me to set his standard of scholarship so high that no common minds can hope to attain to it. What can ordinary poetasters hope for, and how much of edification, comfort, and enjoyment would be lost to the guild of foresters and sportsmen, if we all kept silent?

In versification is everything short of success to be penalized by a rebuke for being so foolhardy as to make the attempt?

I don't wonder at Mr. Brown's preference at his age for the comforts of a tent or camp. These are practicable where a location is to be permanent. But one cannot travel or explore rapidly with these encumbrances. How often have I wished for a tent when I slept with my "face to the stars!" Yet I never carried a tent for thirty-five years. I preferred to rough it and travel light, even in canoe voyaging, which is the acme of backwoods luxury; for then a man can carry comforts so long as he sticks to the water routes. This is what makes the Adirondack region and the Minnesota chain of lakes so charming, where the voyager can go from one body of water to another without breaking bulk. Of course, in wilderness journeys where one can procure poles and bunks, the comfort of a tent or lean-to, or even of a square camp, will pay, during a protracted wet spell, for the labor of peeling and putting it up. On the prairies, where no trees are, and away from lines of transportation, even Indians have to carry their lodge poles and bark or canvas covers with them. Skin tepee covers are rare in these days, and it sometimes costs human lives to obtain them.

Of course, no one wants to camp in "blackened timber," and Kipling's poem did not intimate that he does. He simply introduced the blackened timber as one of the phenomena of a forest region. And yet I would much prefer a camp on a *brule* in Alaska, for instance, to one in the bush, or to one in the Florida everglades, or to one in the flat woods of Wisconsin, with its oozy muskegs and tamarack swamps, with black flies, gnats, and mosquitoes galore in all of them.

Extended travel enables us to profit by results through comparative study, but we cannot predicate the habits, tools, idiosyncrasies and phenomena of one locality by

those of its antipode. Hence I regard much of the matter in the log-jam controversy as power run to waste. Mr. Brown's fanfare of last week, calling the chase off, is the most ingenious allocation I ever read. Such a mingling of the chaste and beautiful with the grotesque and absurd is beyond parallel. It is as queer a combination as Red Gods and Limburger cheese.

C. H.

Natural History.

American Ornithologists' Union.

THE twenty-first congress of the American Ornithologists' Union convened in Philadelphia, Monday evening, Nov. 16. The business meeting was held in the council room, and the public sessions, commencing Tuesday, the 17th, and lasting three days, were held in the lecture hall of the Academy of Natural Sciences.

The fellows present were: Witmer Stone, of Philadelphia; William Brewster and C. F. Batchelder, of Cambridge, Mass.; Drs. J. A. Allen, Jonathan Dwight, Jr., and R. W. Shufeldt, and Messrs. Frank M. Chapman and William Dutcher, of New York City; Drs. C. Hart Merriam, A. K. Fisher, T. S. Palmer, C. W. Richmond, and L. Stejneger, Professors F. E. L. Beal, W. W. Cooke and E. W. Nelson, of Washington, D. C.; H. Nehrling, of Gotha, Florida; Dr. Louis B. Bishop, of New Haven, and John H. Sage, of Portland, Conn. Corresponding fellow present: Dr. Samuel W. Woodhouse.

The members and associates present during the sessions included Geo. Spencer Morris, C. J. Pennock, W. E. Clyde Todd, Dr. Spencer Trotter, Wm. L. Baily, N. H. Janney, J. J. Wisler, Jas. A. G. Rehn, H. W. Fowler, C. Few Seiss, Anthony Robinson, Dr. Wm. E. Hughes, Steward Brown, Sam. Wright, H. L. Coggins, Arthur C. Emlen, W. H. Trotter, J. Harris Reed, Professor August Koch, Thos. H. Jackson, Mrs. Julia Stockton Robins, Miss Elisa W. Redfield, Mrs. Thos. R. Hill, Miss Anna L. Bright, J. Warren Jacobs, Professor H. A. Surface, Mrs. Katharine R. Styer and Frank L. Burns, of Pennsylvania; Louis Agassiz Fuertes, C. Wm. Beebe, Miss Mary Mann Miller, Miss Lilian G. Cook, John Lewis Childs, Mrs. Emeline T. Holden, and Arthur H. Helme, of New York; W. R. Davis, Miss Harriet E. Freeman, Miss Emma G. Cummings, Rev. W. R. Lord, Miss Harriet E. Richards and Mrs. K. Marrs, of Massachusetts; Vernon Bailey, W. H. Osgood, E. A. Goldman and Henry Oldys, of Washington, D. C.; Samuel N. Rhoads and La Rue K. Holmes, of New Jersey; Dr. Eugene E. Murphey, of Georgia; Rev. H. K. Job, of Connecticut; Professor T. Gilbert Pearson, of North Carolina; Mrs. Elizabeth B. Davenport, of Vermont; R. W. Williams, Jr., of Florida, and James H. Fleming, of Toronto, Canada.

Chas. B. Cory was elected president; C. F. Batchelder and E. W. Nelson, vice-presidents; John H. Sage, secretary; Jonathan Dwight, Jr., treasurer; Frank M. Chapman, Ruthven Deane, A. K. Fisher, Thos. S. Roberts, Witmer Stone, William Dutcher and C. W. Richmond, members of the council.

Dr. Samuel W. Woodhouse, of Philadelphia; Professor Dean C. Worcester, of Manila, P. I.; Dr. E. C. Hellmayr, of Munich; Dr. Emil A. Goeldi, of Para, Brazil; Dr. Peter Sushkin, of Moscow, and Dr. Herluf Winge, of Copenhagen, were elected corresponding fellows. Eight associates were elected to the class known as members, and 104 new associates were elected.

Tuesday morning, Dr. A. K. Fisher gave a memorial address on Thomas McIlwraith, whose death occurred Jan. 31, 1903. Mr. McIlwraith was a founder and fellow of the union, and, although deeply engrossed in business, never lost his taste for ornithology. His writings relate mainly to the birds of Hamilton, Ontario.

Mr. Frank M. Chapman's account of an ornithological trip to the Pacific—illustrated as it was with many beautiful lantern slides—brought forcibly to mind the exceptional opportunities afforded the Eastern members of the union, by the Cooper Ornithological Club, to study the avifauna of the Pacific coast after adjournment of the special meeting of the A. O. U., held in San Francisco during May, 1903. Other results of the trip were shown at the present congress. Dr. T. S. Palmer spoke of the bird colonies of the California and Oregon coasts. Mr. Chapman exhibited most excellent views of Farallone bird life, and described the different species found there, and Otto Widmann gave a list of the birds noted during a short stay in the Yosemite Valley.

A paper on Bird Life on Laysan Island—an interesting but little known region—was presented by Walter K. Fisher, who had had extraordinary opportunities for photographing birds on that island. In the absence of the author the paper was read by Dr. A. K. Fisher, who also explained the slides.

Mr. Witmer Stone had gathered all obtainable material relating to John K. Townsend and William Gambel, and incorporated it in a paper of historical interest regarding these neglected ornithologists. Mr. Stone has a happy way of presenting historical facts, and the wish was expressed that his various papers on the older "birdmen" might be collected and published in a volume.

Rev. H. K. Job showed a large series of lantern slides from photographs of birds taken in the bird rookeries of Cape Sable and the Florida Keys, and explained how he waited for hours to obtain snapshots. Ingenious expedients had to be resorted to to secure good results.

Miss Mary Mann Miller described the nesting habits of the whippoorwill, and told interesting facts from personal observation.

Mr. Geo. Spencer Morris spoke of bird life at Cape Charles, Va., and referred to the decrease in recent years among the water fowl found at that noted resort.

The report of the Committee on Protection of North American Birds, read by its chairman, Mr. William

Dutcher, showed that satisfactory results had been obtained during the past year. This was made possible by the Thayer Fund—money secured through the efforts of Mr. Abbott H. Thayer.

New Bird Studies in Old Delaware, by Samuel N. Rhoads and C. J. Pennock, brought out valuable ornithological facts relating to that apparently neglected State.

Invitations were received from the Exposition management and Mayor of St. Louis to hold the 1904 congress in that city.

The next annual meeting will be in Cambridge, Mass., commencing Nov. 28, 1904.

Following is a list of the papers read at the sessions: In Memoriam: Thomas McIlwraith. A. K. Fisher, Washington, D. C.

Notes on the Bird Colonies of the California and Oregon Coasts. T. S. Palmer, Washington, D. C.

Nesting Habits of Florida Herons. A. C. Bent, Taunton, Mass.

New Bird Studies in Old Delaware. Samuel N. Rhoads, Audubon, N. J., and Chas. J. Pennock, Kennett Square, Pa.

The Aesthetic Sense in Birds. Henry Oldys, Washington, D. C.

Notes on the Protected Birds on the Maine Coast, with Relation to Certain Economic Questions. A. H. Norton, Westbrook, Me.

Exhibition of Lantern Slides of Young Raptorial Birds, photographed by Thos. H. Jackson, near West Chester, Pa. Witmer Stone, Philadelphia, Pa.

Views of Farallone Bird Life. Frank M. Chapman, New York City.

The Bird Rookeries of Cape Sable and the Florida Keys. Illustrated with lantern slides. Herbert K. Job, Kent, Conn.

A Winter Trip in Mexico. Illustrated with lantern slides. E. W. Nelson, Washington, D. C.

Some Nova Scotia Birds. Spencer Trotter, Swarthmore, Pa.

Nesting Habits of the Whip-poor-will. Mary Mann Miller, Brooklyn, N. Y.

Some Variations among North American Thrushes. J. Dwight, Jr., New York City.

The Spring Migration of 1903 at Rochester, N. Y. E. H. Eaton, Rochester, N. Y.

Warbler Migration in the Spring of 1903. W. W. Cooke, Washington, D. C.

Some Birds of Northern Chihuahua. Wm. E. Hughes, Philadelphia, Pa.

A Reply to Recent Strictures on American Biologists. Leonhard Stejneger, Washington, D. C.

The Exaltation of the Subspecies. J. Dwight, Jr., New York City.

Variations in the Speed of Migration. W. W. Cooke, Washington, D. C.

An Ornithological Excursion to the Pacific. Frank M. Chapman, New York City.

Bird Life on Laysan Island. Illustrated with lantern slides taken by Walter K. Fisher. A. K. Fisher, Washington, D. C.

Ten Days in North Dakota. Illustrated with lantern slides. W. L. Baily, Philadelphia, Pa.

Two Neglected Ornithologists—John K. Townsend and William Gambel. Witmer Stone, Philadelphia, Pa.

Bird Life at Cape Charles, Virginia. George Spencer Morris, Philadelphia, Pa.

San Clemente Island and its Birds. Geo. F. Breninger, Phoenix, Arizona.

Yosemite Valley Birds. O. Widmann, St. Louis, Mo.

The Origin of Migration. P. A. Tavernier, Chicago, Ill.

A Contribution to the Natural History of the Cuckoo. M. R. Levenson, Brooklyn, N. Y.

Mortality among Young Birds due to Excessive Rains. B. S. Bowditch, New York City.

Collecting Permits: Their History, Objects and Restrictions. T. S. Palmer, Washington, D. C.

Report of the Chairman of the Committee on the Protection of North American Birds. Wm. Dutcher, New York City.

Deer and Sleep.

DEER reverse the apparent order of nature, for they sleep in the daytime and feed at night. How much sleep they do take is a matter of contention even among experienced stalkers—some say little, others much. On the whole, we are inclined to agree with the former, for it has to be remembered that they chew the cud when lying down. Two most experienced and observant foresters, the one in Argylshire, the other in Aberdeenshire, thus gave their opinions: "Deer sleep or rest from about ten or eleven A. M. to four P. M.," "Deer sleep from noon to five P. M."

It is no uncommon occurrence to come on deer asleep; a stalker in the Blackmount had the rare experience of coming upon a parcel of seven stags, all sound asleep. A herd was seen to move in Glenfeshie, but one stag remained behind, lying motionless. On a careful approach, he was found to be asleep. Perhaps, however, the oddest occurrence of this nature happened in Braemore, when a stalking party, on going up to the stag which had just been shot, found a three-year-old close to it fast asleep. In fact, it is by no means rare to get within a yard or two of a sleeping deer.—Scottish Field.

The Nighthawk.

NEW YORK, Nov. 23.—In your issue of November 21, Mr. Peter Flint expressed the desire to hear from some city watcher of the habits of the nighthawk, and have his observations confirmed.

I have heard the peculiar note of the bird, which Mr. Flint describes as *Go-walk*, on so many summer evenings during my residence on Central Park West that I cannot account for the ear of any intelligent listener having failed to hear it. To my mind, *Go-walk* by no means conveys an idea of the sound. It is very difficult to imitate, but I think can best be described by saying that it resembles the twanging of a loose bass string of a guitar. I might add that most of my observations of the bull bats were made from near the top of the Hotel Majestic, although I have also heard the note referred to while walking in the park.

G. B. PERKINS.

Game Bag and Gun.

All communications intended for *FOREST AND STREAM* should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Maine Bg Game.

BANGOR, Me., Nov. 21.—*Editor Forest and Stream:* The feeling of dread with which residents of this State have opened their daily papers each morning for the last fortnight has, in a measure, passed away, as the number of accidental shootings seems to have been ended, at least for the time. So long had the State gone without this dreadful record recurring to anyone's mind, that to have two or three so near together gave one an awful feeling of expectancy, and in many offices and homes the first inquiry of the day has been: "Well, who's shot for a deer this morning?"

Not that there has been such a large number of shooting accidents during this hunting season of 1903, rather on the contrary, but as one fatality in Maine—and another on the border and killing a Maine guide—came close to our own homes and kindred, one didn't know what to expect next. It is devoutly trusted that the record will not be extended any further this year.

Guide George H. Spinney, of Staceyville, who was so critically wounded in the thigh, is reported at the hospital in this city as doing nicely. The surgeon having his case directly in charge is quoted as saying that he hopes strongly to save the man's leg, although when he was brought here it was feared that they might not be able to save his life, and they scarcely dared hope for any recovery without amputation. However, although the wounded man suffers great pain, still he is resting as comfortably as a man could be expected to with the bones of his thigh fairly shattered by a bullet, and barring unforeseen complications, Mr. Spinney will some time be a well man and able to walk.

Guide Charles Berry, of Katahdin Iron Works, was exonerated by a coroner's jury of intentionally causing the death of his fellow guide, Arthur Wilson, of Atkinson, whose name was at first erroneously sent out as Wilkins; but the authorities have taken the matter up, and Mr. Berry is bound over in \$500 for the grand jury, on the charge of manslaughter.

A movement has been started among the guides for raising of a fund to help the widow and family of Wilson, who are, by his death, left destitute, and it is sincerely hoped that there may be a generous amount raised for their relief. Wilson was among the best known of the guides in the "Iron Works" region, as those well acquainted with it always speak of that section, and had been guiding there for many years. He leaves a family of four children, besides his wife and mother, and the blow falls heavily upon the stricken women, who thus have been cut off without warning from the support that they had, for so many years, leaned upon.

And speaking of this matter of accidents, your correspondent was greatly surprised to read, in a recent edition of a Boston daily, a statement made by a returned sportsman that "the accidental shooting of hunters this year is greater than any other season I can remember. I know of several cases reported in the Maine papers that never got as far as Boston." Now, Maine's record of accidental shooting has been anything but commendable in past seasons; in fact, our fair State has been put to the blush many times for her unenviable record in this particular. It was for this reason that the special law applying to such careless shooting was passed, although, by the way, that law has never yet been enforced by arresting a careless shooter—and still, as shown by the season of 1902, there seemed little diminution in the number of these cases. This year, for the first time in years, the State has been comparatively free from "mistaken for game" cases, and the one fatality referred to in the fourth paragraph of this letter is, so far as your correspondent can find out, the only one taking place within Maine's borders since Oct. 1. There have been numerous suspicious cases, which the imaginative have thought betrayed accidents, such as that of the young woman who came out from camp and was carried across the platform from one train to another. The writer was assured that it was a case of accidental shooting; but later met the physician who treated that same young lady for pneumonia in her camp, far inland. As soon as she was able to be moved the homeward journey was begun, but it was disease and not injury that niled her walking machinery. It is hardly fair to blame Maine with more of these accidents than belong to her, and those who have watched the progress of the game season this year feel encouraged that the slate has been kept so nearly clean.

The past week can scarcely go down as ahead of any other week of the moose season, nor yet as a record breaking week for deer shipments, unless it may perhaps be awarded the "booby" prize on both counts. More dissatisfied and unsuccessful hunters have been returning home during the week than in all the rest of the season taken together, according to the judgment of a man well informed in such matters, and who keeps a close watch on these things. This is scarcely due to any diminution in the supply of game. On the contrary there is still enough in the woods, but the recent snow storm, which made such fine hunting for a day or two, softened slightly and then froze, so that the woods are more noisy than before the snow fell at all, if that were possible, and the unhappy hunters have been wishing for the time of leaf carpeted forest, since then one gets a few minutes of fairly decent footing in the early morning, anyway.

Therefore, comparatively few moose and deer have been shipped out, and the majority of those seem to

have been killed on the last snow before it crusted over.

Some parties have met with success as great as it was unexpected, in two different cases coming upon bull moose fighting, and killing them both. In one case two cousins of Olamon, P. D. and N. B. Harris, were out on a hunt and were about discouraged, not having seen moose or deer for the day, and were about to shoot a hedgehog with a revolver when they heard a great noise not far off. Investigation revealed two big bulls having a battle to the death, and as soon as they got near enough to make their aim sure, they dropped both combatants, and took their carcasses to Boston.

In the other case, two men went out from Portage on a hunt, Percy Porter, of Presque Isle, and Harry Dorman, of Portage, and, they, too, discovered a couple of bulls fighting, so that they crept up near and dropped them both.

The new license law, which was passed ostensibly to keep out the Ohio hunters who came here to slaughter the game by wholesale, and to hunt without guides and to eat their own provisions, seems to have kept out a few of them, as few of the large parties from Western States are reported this season. Nevertheless, from personal acquaintance with some of the Western hunters who have come in large parties before, the writer knows of several of them who have been here this season, and taken home their supply of game, and they weren't called pot-hunters, or forest gorillas, or anything objectionable, yet one of them carried home more deer than he has in the past done at all times. Those who met them found that it was actually a pleasure to meet these gentlemen from ———, who, this time, are recognized as sportsmen because they pay the license fee. From personal acquaintance with many of this class, your correspondent is glad that he can say of them as a whole, that they are law abiding, keen and as welcome hunters as the majority of those who seek recreation in the Maine woods, and they are willing to prove it by paying a license fee for the privilege that, in some other State, they would have to pay for, perhaps, as well. But could one get at the exact figures the number of those from the West who have taken two deer apiece out of the State this fall would be surprising to those who insisted that "it" would "keep them out."

If the whole fund received from the sale of licenses is applied to the proper protection of the big game, Maine's game ought to be well watched the coming year, and one will merely need to look up a warden to learn where an abundant supply is when another season rolls around. Maine's wonderful supply of game has increased in spite of a lack of full protection, but it can undoubtedly stand a tremendously increased amount of protection from irresponsible rifles, at all seasons of the year.

Bangor entertained, between trains, a distinguished party of sportsmen en route from New Brunswick to Washington. They were Hon. J. R. Garfield, of the new Federal Department of Commerce, and Chief Forester Gifford Pinchot. They had been on the Tobique, and returned through Arnostook county, bringing with them to Bangor two handsome caribou heads and a buck's head.

Leaving out the two Sundays between now and the end of the month, there are but seven days of hunting left during which one may kill a moose, and a good, deep snow is what those still remaining in the woods, and going in for a late trip, are hoping for. After such a storm a big increase in the moose record may be confidently expected, unless it is postponed too long.

HERBERT W. ROWE.

What About the Woodcock?

ELMIRA, N. Y., Nov. 20.—*Editor Forest and Stream:* Under the above heading I noted in the last *FOREST AND STREAM* that you wished shooters to write you what of the woodcock for this season, now so nearly gone.

In this section the fall flight was good, and bags of 15 to 25 cock to two men were common.

However, the flight did not seem to extend far; say from thirty to fifty miles east and west was the limit when any good bags were made that I know of. As you say, a good shot with a light weight 26-inch 12 or 16 gauge, cylinder bore gun and a good dog, can kill too many of the noble brown birds that we now see so few of in a day, if he happens to get into the fall flight. Thus, my friend, Mr. E. A. Haley, of Bath, N. Y., and I were out after grouse; we started to go through a small piece of lowland in the woods. Four woodcock were there, the dogs stood, four birds got up and were dead almost before one could tell what they were.

There is no summer cock shooting in this State, I am glad to say. Pennsylvania has the month of July, but what pleasure there is in July game shooting I, for one, cannot see.

Referring to the woodcock shooting in the south, I am about to take a southern trip, and mean to learn all I can about my favorite game bird while there.

Grouse have acted very queerly all this season, until about a week ago. They were very wild, would not lay to the dog, were scattered all over the country, one, two, and three in a place.

Within the past week they commenced to act as of old; the dogs could get close points, and when one walked in ahead of the dog and sent 31 grains of Walsrode and 1 ounce of No. 6 shot at them from a 26-inch 12-gauge cylinder bore gun, why it made the feathers fly—if they did sometimes fly off with the bird.

E. H. K.

SPRINGFIELD, Mass., Nov. 19.—The editorial in this week's number of *FOREST AND STREAM* on "What of the Woodcock?" has struck a note which is close to the hearts of most of the New England hunters. The passing of the woodcock seems almost history now, and while more birds have been killed this season than fell last year, the swift flying little fellows are not near as plentiful around this section of the country as they were ten, or even five, years ago.

Some good bags have been reported, one man bringing in thirteen woodcock one day, but this was the greatest day's woodcock shooting which has been heard of in this

locality for many years. Time was when S. T. Hammond and his dog Mack would go romping out into the covers between this city and the Wilbraham hills and come back at night with twenty-five or thirty birds. But Mr. Hammond seldom saw a bird which failed to go home with him at night. There are a few broods of the long-billed fellows raised in our swamps each season, and these furnish a meager bag in the early part of October. Toward the middle of the month the flight birds begin to drop into the covers, and after the first two or three cold nights we have a few days' good shooting with these visitors. But they stay only a short time, and then the woodcock season is over.

This year the flight was scattering, and the warm weather made the birds linger with us longer than usual, but they were crafty with the craft of the woodcock. Your editorial says "the woodcock is so easily killed and flies so slowly * * * that he does not have half a chance for his life." I wish that the man who wrote that could come up here and go through a beautiful cover just over the Connecticut line with us. He would see old Dustaway and his mates working through the prettiest cover of New England alders that he ever saw, and he would hear an occasional woodcock whistle up from under the nose of some staunch old dogs and give the most beautiful exhibition of cockscrew flight that he could wish to see, and if he stopped one out of three birds we would take our hats off to him and say that he was a shot among shooters.

This fall the woodcock have been in fine condition—the few which have been found. One killed last week, a beautifully feathered cock bird, weighed 8 ounces. The young birds have attained their full growth. Up here we blame the people in the north woods and the southern corn fields for the growing scarcity of our woodcock. While at the Rangeley Lakes this fall reports were heard on all sides of the large number of woodcock in the covers, and since then people in that section have written of bags of twenty and twenty-five birds killed in a day. These are the birds which would naturally drift into the Massachusetts covers in their flight to the south, and these big bags are the chief cause of the passing of the woodcock with us. Of the slaughter of the king of the sporting birds in the south, your southern correspondents will have much to say, both for and against, but we New Englanders hope that it will be mostly against.

CLICK.

NEW YORK, Nov. 20.—*Editor Forest and Stream:* I have been out for woodcock, commencing October 14, with the following result: 2, 1, 7, 1, 4, 6, 4, 4, 3, 6, 2, and the last time, November 18, when I got 4, making a total of 44 birds killed within twenty-six miles of New York City Hall. I know of two other gunners that hunted in the same vicinity with about the same success.

I can say that I found as many birds as I have any year in the last twenty years, but surely not as many as when I commenced, fifty-two years ago.

E. S.

North Carolina Game and Fish

RALEIGH, N. C., Nov. 18.—The hunting season in North Carolina has so far been unfavorable, the weather during November having been unusually dry, and for the most part warm, with temperatures on some days as high as 75 in the shade. Some good bags of partridges have been made, however, though the birds are mainly in thickets along the streams, many of the streamlets being quite dry. It is found that even yet a number of the birds are not grown. This was the case last year also. Many sportsmen hold the view that it would be better to have the shooting season begin December 1, and last three months. In Mecklenburg county there are only two months of open season—December and January. Arrests have been made there of persons violating the law by having birds in possession.

The protection of partridges this year, under the Audubon law, is found to be very satisfactory for the first year's operation of the new Audubon law. There are complaints in some counties by local sportsmen that non-residents are violating the State game laws. As yet there are wardens for only about fifteen of the ninety-seven counties. The Governor issues commissions to these upon the recommendation of Gilbert Pearson, the secretary of the State Audubon Society. The law is generally very well received and prosecutions under it for the killing of partridges and turkeys are having a good effect.

There is plenty of big game in the eastern counties: deer shooting is good, turkeys are quite abundant, and some bear have already been killed. Newberne is quite a center for sportsmen. There are large lakes of fresh water owned by the State, not very far from there, which afford not only fine shooting for ducks, but also give sportsmen a good opportunity to find game in the woods surrounding these waters. Hyde county is also a capital place for shooting large game. As yet the duck shooting on the sound has been poor, owing to the warm weather. It seems to be certain that more sportsmen from the north will be in the State this year than ever before. Many have leased lands for the hunting privileges, though in some counties this sort of thing is entirely unknown.

Partridges are, in the last few years, more and more acquiring the habit of taking to trees, this being certainly the case in this section of the State. There never was so much food for birds before. Not only is there a large crop of natural food this season, but the acreage in peas, of the kind known as the cow pea, is by far larger than ever before in most parts of the State. Questions are frequently asked the writer as to the best places in the State to visit for partridge shooting. It would be very difficult to designate such points, as the shooting is certainly good in at least fifty counties west of the mountains, there not being a great many birds west of the blue ridge.

The fishing this season has been very good on the coast, particularly of the trout, which are so highly prized north. One of the largest trout ever taken in the State was caught this week near the mouth of Neuse River. It weighed sixteen pounds and was sent to New York upon a special order.

Some very good work has been done in the way of fox chasing this season. There are some good packs in several of the counties, one of the best being in Cumberland.

There is a fine pack a few miles south of Raleigh belonging to a Mr. Stephenson. For many years the late Mr. William Boylan kept a noted pack here, and later Mr. Campbell had a fine one. There are plenty of foxes this season, and they are seen within a mile or two of this city.

The United States Fish Commission car has been here and in other points in this section for a week or more, distributing black bass and bream, mainly to private ponds. The fishing for black bass (called here chub and perch) has been excellent all the autumn, in fact unusually good.

Mr. William Robbins, whose home is two miles from Raleigh, is breeding beagles for use in rabbit hunting on his extensive farm. He has had bad fortune in losing some of his finest dogs.

Vermont Game.

ENOSBURG FALLS, Vt., Nov. 16.—*Editor Forest and Stream:* Where are the wild geese? Up to the present time but a few small flocks have put in an appearance in this vicinity. This must mean mild weather away north, and when they do come their stay with us will be but for a short time, as our marshes will soon be frozen up solid.

The migratory flight of birds southward is a thing but imperfectly understood by the general public. It is our belief that many times the migratory flight of birds is high in the air, and that they fly long distances without stopping to feed or rest.

Late one afternoon in October some years ago we witnessed such a flight. Figuratively speaking the heavens above were full of birds of all kinds and sizes going southward. The geese, ducks, gulls, and other variety of large birds were flying very high, mere specks in the air, and without doubt extended far beyond the vision of the naked eye. Their cries and calls made such a clamor that the noise first called my attention to the flight.

They were all flying in a slow plodding kind of a way, as though they had come a long distance and had still a long journey ahead of them to go. With the exception of the strata of bluebirds who were quite near the ground, the old birds were going on at a steady gait, but the young birds were darting about here and there and chirruping in a frolicsome manner, as though they considered this migratory business a great lark; they would alight on a stump or a rock for a moment, then rush on to catch up with the old parent birds. A severe cold wave followed this flight which brought our pleasant weather to a sudden close.

As for game notes in this vicinity this season, native bred ducks have been quite abundant in our marshes, and in some localities the ruffed grouse and woodcock have been very plentiful, though most of the woodcock were flight birds. Where the late frosts last spring did not touch and destroy the nuts, gray squirrels are fairly plentiful. The farmers' friends, red foxes, are here in goodly numbers. A couple of our local hunters have so far bagged eleven of the mouse hunters. From the general smell around the country we should say that the skunk trapper is meeting with powerful success. It is a fact of natural history not generally known that the color of the skunk found up among the rocky hills is far blacker than those found down on the sandy plains.

We have no report as yet as to the exact number of deer killed in this State during the past open season. It will quite likely exceed that of past years. A large number of does have been reported as being found shot.

We have always claimed that too short an open season is a grave mistake. If we are to have an open season, we should have one long enough to rob it of its novelty. During the short open season of ten days the whole male population of our country and many of our neighbors were out with guns, and scouring through our small woods they started out every deer, who were almost sure to bump against a fellow with a loaded gun, and it is a wonder that any escaped without being either killed or wounded, and too many of the gunners that were out would blaze away at anything that was a deer, which accounts for the large number of dead does and fawns found lying about our fields, food for foxes and skunks.

With a sixty-day open season on deer, very few of our farmer boys would go out deer hunting unless they saw a buck crossing their fields, and then there would be no mad rush and excitement which causes so much illegal shooting. Our motto is "Either a close season or one long enough to rob it of its novelty," then only one deer with horns to be killed by any one person, and have the penalty for illegal killing a term in the workhouse as well as a fine; this would in a great measure keep in check a set of lawless fellows who are loafing around with a gun when they should be at work. Regarding a license for non-residents, that will come when we have salaried game wardens.

STANSTEAD.

The Scarcity of the Partridge.

WHAT is going to be done to save the partridge? is the question that confronts sportsmen, and which the next Legislature will be asked to decide, says the Worcester, Mass., Telegram. The partridge is being shot to extinction, and in the opinion of A. B. F. Kinney, one of Worcester's best known sportsmen, and first vice-president of the Massachusetts Fish and Game Commission, something has got to be done to save the bird.

It is Mr. Kinney's recommendation that sportsmen decide on some plan that will be the most feasible from all points of view, incorporate it in a bill to the Legislature, and have laws made that will preserve the bird. In the opinion of Mr. Kinney and other sportsmen, the partridge will be extinct in this State in three years unless something is done.

In the hunting season for birds, which is now coming to a close, there has been the greatest scarcity of partridge that has been known in some years. One reason for this was the wet weather in the spring which killed the young birds, and but few were raised. Hunting has gone on just the same.

There have been just as many and more partridge hunters in the woods every day, with the result that what few have shot birds have killed the old birds. Now

comes the question of where the young are to come from next year. The point has been reached, in the opinion of Worcester hunters, where a halt has to be called to save the bird at all.

This week two men were in the woods hunting partridges for two days, having two dogs with them. This combination of twos scared up just six partridge. It was clear to the hunters that of these six every bird was an old one, and cautious enough to get out of the way of the hunters. The hunters covered twenty-five miles of ground on their trip without securing a single partridge. Another hunter, who had been out three days a week since the hunting season opened, says he has not seen a young bird this year.

Reports come from Connecticut and Vermont showing the same conditions. Letters to hunting papers from these States state that the shortage of partridge is greater than ever experienced before, and the question is asked on all sides, what is going to be done to save the partridge?

It is up to the hunters and sportsmen to take up the matter in a fair way and decide what is going to be done. If the present method goes on there is no chance, in the opinion of Mr. Kinney, of saving the partridge. If the hunter wants to exterminate the bird from New England and give up his pleasant and exciting hunting trips for the favorite game of this section of the country, he has only to continue in the old rut and go on shooting the old birds, while no young are being hatched.

Mr. Kinney told a reporter for the Telegram last night that he saw two plans which the sportsmen might adopt to save the partridge. One is to settle yes or no whether to stop hunting the partridge altogether for a year or two. If this course is adopted it will give the birds a chance to get started again and get numbers enough so that they can withstand hunting.

The second plan and the one which Mr. Kinney is in favor of, is for the Legislature to pass a bill which will limit the number of partridge and other game which a man can shoot. Mr. Kinney would recommend that a hunter be allowed to shoot not more than two partridge, two woodcock, and half a dozen quail a day. Or if this is not satisfactory, limit hunting to two or three days a week, and allow no hunting on other days.

His opinion is that the hunters and sporting men do not want the season cut off or taken away entirely, and that a fair adjustment of game to each hunter will have equally as good effect in saving the birds.

The plan of limiting the amount of game to be killed ought to satisfy every legitimate hunter, he says. It will give the hunter an opportunity to roam and scour the brush to his heart's content and give him game enough to satisfy the desires of any ordinary sportsman. The hunter gets the same amount of recreation and sport as if he attempted wholesale slaughter of the birds.

Mr. Kinney says he would like to see a bill framed for the Legislature with some satisfactory adjustment of the game limit to save the partridge and other game. He says he believes in receiving through the Telegram the version of hunters of Worcester county on the question. There is no doubt but that some provision will come up in the next Legislature for the preservation of partridge, he says.

Massachusetts Deer.

SPRINGFIELD, Mass., Nov. 19.—Deer are increasing rapidly in this section of New England, and it is no uncommon sight to see a doe or a buck in the edge of the woods or to find the little sharp cut hoof prints in the sand of a wooded road. The laws of both Massachusetts and Connecticut forbid the killing or hunting of deer, yet some are killed each season, for there are always men who have not the good of the sportsman at heart. A case of a deer being killed by hunters was reported from Somers, Conn., last week, and Game Warden Eaton, of Stafford Springs, is now investigating the case. The case is a peculiar one, and has a rather humorous side which shows that it is an ill wind which blows nobody good. Henry A. Root, formerly of New York, but now closely connected with the Butte copper interests, has a summer home in Somers, and the other morning sent one of his men to the village on an errand. As the man was driving through the woods he heard a crashing in the brush and stopped his horse to see what the matter was. Soon a large doe came out on the bank above him, staggered for a moment, and then fell down into the road, dead. The man got down to examine the deer and found two bullet holes in its neck, and it had bled to death because of them. Someone had tried to kill the deer, but had only wounded it, and it escaped from them. The man put the carcass in his team and drove back to the Root homestead with it. So Mr. Root had the venison and the game warden is hot on the track of the men who were instrumental in his getting it.

CLICK.

Editor Forest and Stream:

This article is written with the hope that every Massachusetts sportsman who reads it will lend his hearty support for the enforcement of the existing deer law and toward the enactment of any law to further protect the deer in this State.

In the small space of territory within the towns of Barnstable, Falmouth, Mashpee, and Sandwich, a territory about fifteen miles square, there are at the present time probably 200 to 250 deer. Now, if these deer were left unmolested to increase as they naturally would, it would be but a few years before it would be no uncommon sight to see them almost anywhere in our woods. But are they left unmolested?

Far from it.

It seems to be an unwritten law in this section that if anyone wishes to hunt deer no one will say anything about it. The way people here speak about it is this: "Oh, well! If the 'boys' round here want to get a deer or two in the winter I don't object."

Now, suppose we follow this line of reasoning to its logical conclusion, what will be the result? I can name in the town of Sandwich, with its 1,400 inhabitants, fifty hunters, and the proportion will hold good in the other towns. Now, if each one took advantage of this unwritten right, how long would it be until there was not a deer in this section?

Of course all do not take advantage of this state of affairs, but there are a few game hogs who do, and who also abuse the privilege by bringing in their friends from Rhode Island, New York, and from many of the larger cities of Massachusetts—Boston, Cambridge, Newton, and others, with the assurance, "Oh, you need not be afraid. No one will bother you."

Now, to my mind, and to that of a number of others here, it is high time that this business was stopped. I do not wish to blame the Massachusetts Fish and Game Commission in this matter, because with the number of deputies and the small appropriation which they have, it is very hard to cover all parts of the State.

It does, however, seem too bad that what is probably the largest colony of deer in the State cannot be better protected.

I sincerely hope that every sportsman who reads this article will exert what influence he may possess to bring about a different condition of affairs.

Of course a few persons in this section who wish to see the law enforced can do but little, but the united effort of the sportsmen throughout the State can do much to stop this violation of the law. Therefore, fellow sportsmen, I appeal to you. If you have any influence which you can bring to bear on this matter, either through legislation, through the Massachusetts Fish and Game Protective Association, or through the Massachusetts Fish and Game Commission, do exert that influence both in the interest of this section and of the State in general.

JAMES M. MCARDLE.

SANDWICH, Mass.

Mud-Sounding in the Adirondacks.

Editor Forest and Stream:

I once gave your readers an account of the attempts of a tenderfoot to explore the outlet of a certain pond, specially with reference to the mud on the bottom. Although he was long-legged and fell in twice—each time he attempted to cross on a fallen tree—he did not find the bottom. This season another young man at the same pond and outlet met with better success, for he used more of his length. With his fiancé, some other ladies, and two guides, he had gone to the pond to give the ladies a camping trip, and incidentally to kill a deer. The pond has long had a reputation for deer. It is likely to have for some other things.

The young man had not got a deer—he must shoot something. A little bird, a "tip-up," took most convenient position on a rock along shore some two or three rods from the rock on which the mighty hunter was standing with one of the ladies. The gun was leveled with deadly precision—a glance—and it belched forth its deathful charge. What became of the bird deponent saith not—the young man was of more consequence. He lost his balance by the recoil of his gun and fell backward into the mud and water. He went in nearly to his neck, and was rapidly disappearing, when the lady on the rock coolly stooped and seizing him by the collar drew him up beside her. As a retriever she was entirely successful. Then one of the guides took him in charge. They went to camp; he stripped, put on a long waterproof (too late), and assisted the guide in drying his clothes. Between them they managed to burn up his underwear and to burn so large a hole in his trousers that one of the ladies had to remove a skirt and with it patch the trousers in order that the poor fellow might return to the hotel decently. It is believed that in his mud-sounding he touched bottom. It is certain that his experience afforded great amusement to the entire party. Whether he is still ambitious to slay a deer is unknown to

JUVENAL.

How to Cook a Duck.

TWIN LAKES, near Rockwell City, Iowa, Nov. 7.—*Editor Forest and Stream:* The rest of the boys are downstairs occupied with fifty-two small pieces of pasteboard, and I am sure they must be patriotic, because they are exhibiting the national colors in front of them in small round objects, like buttons, each contributing to a pile in the middle of the table, this pile being awarded to one of the party after comparing the pictures on the pasteboards. The copy of FOREST AND STREAM which I carry in my grip on these trips offers me more pleasure than the proceedings downstairs possibly could. But I had no sooner begun to read it than I encountered something which makes me grab for pencil and paper. For this thing can't be passed over. Under the head of "Camp Cookery," on page 359, November 7, J. W. B. appeals to you for bread, and verily you have cast a rock at him—literally, too, for if he follows the advice to parboil ducks he will get a "rocky" result. Now, when the criminal code is revised with due regard to the rights of men who spend their time and money and invigorate their bodies to bring the most toothsome piece of wild game to the table, it will be written down a crime, as it surely is a sin, to parboil a duck. Seneca's only hope for forgiveness lies in the fact that he says a duck "may be parboiled." Yes, it may, and the unappreciative cook sometimes does parboil it, but it is a sad mistake. It takes the rich juice out of the meat and makes it dry and flat. It is astonishing how few cooks who can do almost everything very well, know how to cook a duck. Even those who have been doing it for years sometimes fail miserably, and I am sure their "men folks" don't go hunting for the sake of the delicious duck meat, which they do not get. One other thing not to do, and then in a few words what to do: Never skin a duck; I am almost ashamed to intimate that such a caution is necessary, but it is sometimes done. It lets the juice out and makes the meat dry, tough, hard, and altogether unpalatable.

After the bird has hung in cold storage, not drawn, for from three to fifteen days, pick it very carefully, dry, never scald. Singe very little, and only when absolutely necessary. Dress the duck with extreme care and nicely. Now we are ready to decide whether the bird shall taste "strong" of the wild flavor or not. Many sportsmen want this strong wild flavor, and for them no further cleaning should be done. The bird may then be prepared for roasting or broiling, as desired. But the great majority of people prefer the wildness slightly tamed, toned down and

made more delicate, and this is easily done by thoroughly washing the inside with cold water and wiping with a cloth until the cavity is perfectly clean, for it is the clotted blood and other deposits that make ducks taste "strong." The flesh of the edible wild duck, properly treated, is not "strong." We have revealed this fact at our own table to people who had an avowed aversion to wild duck, and did not know how sweet, tender, juicy, and delicately flavored it could be.

The tastes of people differ as to dressing, but it is well to have it moist, and plenty of finely chopped apple or celery is excellent for this purpose. No duck, however small, is as good without dressing as with it; but for those who do not care for it, a teaspoonful of currant jelly on the inside is sufficient. When the birds are placed in the roaster (breast down, to allow all the juices to remain in the thick meat of the breast), lay across the back of each duck two very thin slices of the best bacon you can get—vary the quantity according to the size and fatness of the birds. Always use a tightly covered roaster to retain all the steam and flavor. This bacon, if it is of the right quality, will mellow the taste of the meat and add flavor to the gravy. Another caution: Do not roast the ducks too long. Twenty minutes leaves the meat very rare, and from thirty to forty minutes roasts it for the average taste. More than this in a good oven, with a covered roaster, will overdo it. Of course, ovens differ, and with a slow fire a longer time is required.

All this is for home use, of course, as the operation has always been directed at our house, adding greatly to the pleasure and profit derived from our game.

F. W. B.

Staten Island Robin Shooters.

PRINCE'S BAY, N. Y., Nov. 18.—*Editor Forest and Stream:* The following will show how things go sometimes—not always, but sometimes. It is from the Richmond County Advance:

"As Game Protector Edgar Hicks boarded a Midland car at New Dorp on Wednesday evening, November 11, his attention was attracted by a bundle carried by an Italian. On investigation he found that it contained twenty-four robins. He then placed the Italian and his companion under arrest, and had them locked up at police headquarters, Stapleton. The men, who proved to be Charles Bresopoli and H. Cantulppi, were arraigned before Magistrate Marsh the next morning and discharged."

Now, these Italians felt bad; they did not want their names to appear in print, one of them especially. He said he was an editor of a newspaper. The words were put in their mouths that they were ignorant of the law, etc. When searched the editor of the newspaper had in his pocket a gun large enough to be mounted on the bow of the Cherokee for her trip to blockaded ports. An officer tried to have him punished for carrying concealed weapons; but no, he was a gentleman, and did not know it was against the law; and he was cleared, and did not ask for a permit to do so again.

This is only one case. Others have been different. But it's a bad precedent to have established. Now read the paper and see how they do it in Hoboken. It goes to show that when a man is violating the law in Jersey no song and dance act by his colleagues can help him out. Italians seem to have the right of way in the slaughter of our song birds. ***

Game Preserves.

Editor Forest and Stream:

By the heading over my last week's scrap I fear you are giving out a wrong impression. I am not opposed to game preserves of the right kind; but I object to any clubs having jurisdiction over ten or fifteen miles of country, so that if a man wants to get across that region he must go a day's journey round. It would be a nice little arrangement if that part of the country should be settled up.

If I were the autocrat of America, no club or set of men should own more than 5,000 acres instead of 15,000 or 20,000 which some clubs have.

I cannot understand how an intelligent man who has the slightest regard for his fellow mortals can assist in framing such a set of laws as those by which the Blooming Grove Park Association attempted to control the country round them; and common sense should have shown them that they were unconstitutional. Moderate sized game parks are well enough, if properly managed, but if controlled by selfishness in such a way as to incite outsiders to acts of destruction by fire, and even the extremity of murder, I am not in sympathy with them.

DIDYMUS.

ST. AUGUSTINE, Nov. 21.

Ramapo Valley Grouse.

IN 1890, or year thereabouts, Mr. Justus Von Lengerke killed seven ruffed grouse in one day in the Ramapo Valley, near Oakland, N. J. This has been the top valley record for many years. Many attempts have been made to tie or surpass it. This may seem, to the uninitiated, to be an easy matter. Those who have shot in the Ramapo Mountains know that it is not. The shooting is of the most difficult kind. However, on Wednesday of last week, Capt. A. W. Money, of Oakland, tied the record of seven ruffed grouse in the Ramapo Valley, and has a just feeling of satisfaction over the difficult performance. It will probably be over another decade before this record is tied again.

The New York Deer Hounding Law.

THE following resolution was passed unanimously by the Essex county supervisors last week:

"Resolved, That the Board of Supervisors of Essex county put themselves on record as favoring hounding, and the repeal of the Malby law known as the anti-hounding law, and that a copy of this resolution be forwarded their representatives in the State Legislature."

This action is intended to assist Assemblyman Graff in his efforts for the repeal of the hounding law, and it will also serve to prove the falsity of the statement attributed to Chief Protector Pond that Essex county wants a non-

hounding law. Mr. Pond as an author and advocate of the law might naturally be expected to make such a statement, but every resident of Essex county knows it to be contrary to fact. The hounding law is not popular, and it is not enforced, and Protector Pond knows that it is not enforced. Why, then, continue such a law? If Protector Pond is consistent he should use his efforts for the repeal of a measure which he does not enforce and which seems to throw all game laws into bad repute.

J. B. BURNHAM.

Shooting Casualties in Ontario.

THE number of men shot in Ontario through being mistaken for deer or through criminal carelessness, appears to have been larger in the deer hunting season which has just ended than in any previous one. It is hard to understand how any man whose sight is good enough to enable him to see and shoot deer can mistake a man for a deer unless he is drunk or partly so. It is possible that most of the accidents have been due to the too common idea among hunters that they are not fully equipped unless they carry whisky flasks. Whisky or other liquor is all very well in a hunting camp, to be used medicinally there or when the hunters come in chilled or wet; but the man who carries it in the woods along with his rifle is dangerous to all others in his neighborhood. We have laws to punish those who take human life through criminal carelessness. If they do not apply to the hunters, with or without flasks, drunk or sober, who shoot men they should be amended at once.—Canadian Champion, November 19.

Carrier Pigeon Shot.

AMAGANSETT, L. I., Nov. 23.—On November 14 one of our young sportsmen shot at five birds flying high over his head, and accidentally, I suppose, wing-tipped one, which proved to be a pigeon. On its leg was an aluminum band with the letters P. F. and the figures 41,940 stamped thereon.

The bird is alive, and will be returned to its owner by request.

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Fish and Fishing.

In Defense of the Pike.

"A FRIEND of the Pike, who has written me a stinging criticism of the supposed position that this wolf of the water should be exterminated from the northern lakes and streams of Quebec, waxes quite warm in praise of the game qualities of *Esox lucius*. He suggests that there is something of a conspiracy among modern writers on fish and fishing against the continued existence of the pike in angling waters, but reminds me that Dr. G. Brown Goode classed him among the game fishes, and that Mr. Tomlin thus eloquently defends him: 'I care not if this family are the sharks of fresh water, they are entitled to fair play. His Satanic Majesty is never so black as he is painted, so the *Esox lucius* is cousin german to the *Nobilor vulgate* mascalonge, and partakes of his noble nature. He is a foeman worthy the steel of the most ardent angler. Some anglers call the family 'snakes.' I pity them. Go where pike can be found, fish for them with legitimate tackle, and give them a fair chance, and they will give just as much pleasure as any royal small-mouth bass that ever swam."

My correspondent is altogether wrong in his assumption that I am anxious to see the pike exterminated from our northern waters. Like him, I have fished for it in Lake St. John and in the Peribonca River, from which the largest specimens reported in America, so far as I have been able to ascertain, have been taken, one of which weighed 49 pounds and the other 42. And I have enjoyed the sport, though it had not the same attraction for me that the same art had as a boy, when I trolled for "Jack" in English waters. Nor am I able to agree with Mr. Tomlin that the pike will afford the same sport that the small-mouth black bass does.

I had hoped that it had been made perfectly plain that my agitation for the destruction, or at least for the thinning out of the pike in the Peribonca River, was not because of any antipathy to him as either a game or food fish, but simply because he stands in the way of his betters, for whom his mouth is an open sepulchre. Dr. Goode, to whom my correspondent refers me, admits that the pike has few friends, and says that angler-fishcultists have good reason for their spite, since the hungry *Esox* is a sad foe to the proprietor of a fish preserve, and that until it has been banished from a pond, no other species can be expected to thrive.

Trout and ouananiche abound in the Peribonca and some of its tributaries, and plantings of both young salmon and ouananiche have, I understand, been made of recent years in some of the smaller streams flowing into the river in which the largest of these pike are found. It is perfectly certain that there cannot be any sensible increase in the other fish of these waters while the increase of the pike is permitted to go on uninterruptedly, which means that the planting of young salmon and ouananiche where the pike abound, simply enables the pike to increase in number and to put on additional weight, as I pointed out in a former letter.

The pike in these waters grow to so enormous a size and there is so much satisfaction in the killing of the huge tyrants, that I should really regret it as much as anybody else if some stretch of water was not left to them. But some of the tributaries of the Grand and Little Peribonca, and particularly the Aleck and the Riviere

des Aigles are so admirably adapted for nurseries for the young of various varieties of the Salmonidae that it is scarcely reasonable to ask that they should be given over to the pike.

However, even should the greater number of the pike in the lower stretches of the Great Peribonca be destroyed, there are many reedy and weedy localities above the Chute au Diable and between the eighth and ninth falls of the river, where the pike are always likely to be plentiful enough. Twelve to twenty pound fish are often taken here, and there are also very much larger ones to be seen and caught there, as well as in Lake Tschotagama itself, some miles higher up the stream.

The enormous natural increase of this fish is illustrated by Buckland's statement that in a pike of 28 pounds the roes weighed 21 ounces and contained 292,320 eggs, while in one of 32 pounds there were 595,000 eggs, weighing 5 pounds.

It is perhaps rather remarkable that there are no records of any such colossal pike as those found in Lake St. John waters to be had in the annals of American anglers fishing in the United States. I am inclined to think, with Dr. Goode, that this may be due to the fact that large pike are usually pronounced by uncritical anglers to be maskinonge. Even Dr. Bean does not cite any very large specimens of the pike as having been killed in American waters. Referring to the 145-pound fish said by Mr. Pennell to have been captured at Brengenty in 1862, and to the Scotch record pike of 72 pounds, recorded by Daniell in his "Rural Sports," Dr. Bean quotes Frank Forrester's mention of individuals of 16 to 17 pounds each in America, and the case of one caught in Lake George in 1889, which weighed a little more than 16 pounds.

The pike of Lake St. John and the Peribonca take with equal avidity the spoon, phantom minnow, and either live or dead minnows or other small fish. They are lively enough in these northern waters and make a prolonged resistance when hooked. Dr. Henshall is authority for the statement that they will rise to a large, gaudy fly. It has never been my luck to hook one in this manner, though I have taken the doré or wall-eyed pike on a trout fly.

Many Americans object to the pike as food, declaring him to be bony and without flavor. Taken out of the cold northern waters of Canada and well and promptly cooked, however, he makes a very delicate morsel.

"Roast him when he is caught," said Izaak Walton, "and he is choicely good—too good for any but anglers and honest men." There are various methods of doing this. For my part, I prefer the fish baked, with a forcing of bread crumbs, herbs, lemon peel, and butter. Thomas Barker, in his "Barker's Delight, or Art of Angling," written before the time of Walton, orders the pike to be stuffed with oysters and butter, and to be basted with claret and then with butter while roasting.

It was this same Barker to whom Walton was largely indebted for what little he knew of fly-fishing, and who, by the by, was the first writer to speak of the sport sometimes enjoyed in England of tying one end of a line around the wings of a goose, and baiting the hook at the other end for pike, so as to bring into conflict the goose on the surface of the water and the pike below, until the latter is tired out with its continual struggling.

If the story of a pike which comes to me from Carling in the Georgian Bay district be true—and I have no reason to doubt its correctness—it will help to explain what becomes of a large proportion of the young pike that are hatched. An angler named Moore was out trolling with a daughter of Mr. Alex Alves, when the little girl, who was holding the line while Mr. Moore rowed, felt a strike and handed the troll over to her companion. As he proceeded to draw the fish toward the boat, the line at first came easily, showing that it was a small fish that had been hooked, but a sudden tremendous jerk indicated that something unusual had happened, and the line was almost dragged out of his hands. It was gradually drawn up again near to the boat, when the heavy strain suddenly relaxed, and it seemed for an instant as if the fish had escaped, when again, as the troll was about to be lifted into the boat, the line was seized a second time and again released. Rapidly lifting the troll into the boat to examine the hooks and make a new cast, a small pike was swung into the boat, which had been all the time securely hooked, and in a great deal less time than it takes to tell it, a monster pike rose up alongside the boat, and following closely the troll upon which was the small fish, the larger one landed over the side into the boat. It was secured and killed and was later found to weigh twelve pounds. An examination of the small pike showed that its sides had been cut and torn by the teeth of the larger one, which had twice seized and tried to swallow it as it was being drawn toward the boat.

How Cod Fishing is Carried On.

The system of prosecuting the cod fishery of Nova Scotia has undergone a considerable change during the last few years, so that ports which until recently sent out hundreds of fishing vessels have now lost all importance as fishing ports. Lockport and Shelburne are cases in point. Lunenburg, on the other hand, has become the greatest fishing port in Canada—in some respects in the world. It owns and fits out the largest banking fleet, as it is called, in the world, sending out nearly 350 vessels, registering over 30,000 tons and carrying over 5,000 men and boys. This great fleet annually lands, approximately, 50,000,000 pounds of cod, which realizes a value of \$1,500,000. The secret of the success of the Lunenburg people lies in the fact that they have adopted the co-operative principle in the fishing industry. The great majority of the vessels of the place are owned by those who sail them. The shares in these vessels are usually by sixteenths, though some vessels have twenty-five or more owners. A sixteenth share in a new vessel is usually worth about \$364, and the owner of it, in a good season, may make some \$700 in a few months.

Gulf Fisheries are Threatened.

The professional salt water fisherman, like too many of the fishers in fresh water, frequently act as if they believed it beyond the arts of man to exhaust the harvest of the water, despite the teachings of experience to the contrary. Some of the fishermen of the Gulf of St. Lawrence are now in a state of alarm, and not without good

cause at the continual diminution of the catch of codfish in their waters. The two principal causes which are believed to have contributed to this result are the destructive use of trap nets, and steam trawling for cod and herring, and also the growing scarcity of bait for cod due to the habit so long practiced of seining herring, capelin, and other small fish by wholesale, in the spring of the year, for the purpose of using them as fertilizers for the ground. In this manner it is claimed that millions of tons of the most desirable food have been wantonly wasted. The consequent difficulty at times of securing a proper supply of bait, and the steady decrease in the quantity of codfish visiting the coasts have now alarmed some of the fishermen to such an extent that some of them have petitioned the Government Department of Fisheries at Ottawa to prohibit both the steam trawling for cod and herring, and also the use of fish as manure. No action has yet been taken on the petitions, but it is understood that the matter is now engaging the serious attention of the Government. On the other hand, it is claimed that the petition is being opposed at Ottawa by the representatives of an American syndicate which has been formed for the purpose of operating steam trawlers on a very large scale off the shores of the gulf and the Baie des Chaleurs.

E. T. D. CHAMBERS.

Massachusetts Game Interests.

BOSTON, Nov. 21.—*Editor Forest and Stream:* Shore gunners have been getting good bags the past week at Monomoy (Chatham) and Eastman. At Assawamsett and Long Pond man geese, duck, teal and whistlers have been secured by owners of "hides."

Deer are reported numerous about New Bedford, being often seen from passing trains; one, a fawn, has been killed by a locomotive; also a fine buck which was found dead beside the track near Myrick's junction. It is supposed the presence of deer in this section is due to their being driven from their haunts in the Sandwich and Plymouth woods by forest fires or possibly by being chased by dogs. It is a well-known fact that some of the natives have been accustomed to hunt deer for years past in these towns. No outsider is allowed to kill them unless he in some way gets under the protecting wing of a resident. The method of doing this is well understood by the knowing ones.

No section of the State furnishes a better breeding ground than the Sandwich woods, and if the illegal killing of them could be stopped the animal would become very plentiful in a few years.

For Sunday gunning in Medfield, A. L. Boyden and F. J. Mahoney, of Norwood, were fined on Monday \$10 each.

Three Massachusetts gunners were arrested last Saturday on board a train returning from New Hampshire with partridges which they were taking out of the State illegally. They were taken by A. J. Cardwell, a warden in the employ of the New Hampshire Commissioners, who was attired in hunting outfit and carried a gun to complete his disguise. Having learned from them the result of their trip, and that the birds were in the baggage car, he took them off the train and Justice Greenough, of Atkinson, fined two of them \$10 each. The case of the third man, who had ten birds, was brought before Justice Hills, of Plaiston, and resulted in his imposing a fine of \$90. The first two gave fictitious names, but it is understood they are members of the Malden police force. The third man is a resident of Lynn.

One of the active clubs which has done much to advance the work of protection in Massachusetts during the past few years is the S. Acton Fish and Game Association. It was represented in the convention of a year ago by its president, Mr. N. J. Cole, and others. The club held its annual meeting and banquet with a large attendance on Thursday evening, November 19. Several pleasant hours after the dinner were occupied by a smoke talk and social. The officers of last year were re-elected, Mr. Cole as president, Mr. Warren Jones as vice-president, and Mr. C. M. Kimball, secretary-treasurer.

At a recent meeting of the directors of the Megantic Club, suitable resolutions were adopted on the death of Mr. Clarence A. Barney, who had served several years on the board and was a faithful officer as well as a sportsman of the highest type. The club has recently purchased 425 acres of land covering Indian River and the shore of Spider Lake to the Paxton place, and thus, with present holdings, securing to the club desirable rights in Spider Lake. Mr. Howard Plowman has presented the club as a gift 100 acres north of the Boyle farm, covered with a young growth. Mr. Arthur W. Robinson, a former president of the club, and Mrs. Robinson have been stopping with Mr. and Mrs. D. C. Pierce at their private camp at Chain of Ponds. Mr. and Mrs. Robinson each shot a buck, and Mr. and Mrs. Pierce got two each. Mr. Pierce says big bucks with good antlers are more plentiful than he has ever before seen them, and foxes and bears are abundant. Mr. Robinson's brother, Henry W., was with the party a portion of the time.

I am informed that several members are planning to build camps before another season; also in order to better accommodate members who live in New York, Hartford, Philadelphia, and other places outside of Massachusetts, it is proposed to hold the annual banquet the coming winter in New York city. It is thought the date will be Jan. 30, and that it will be at Delmonico's. Members who have visited the club during the year are enthusiastic over the sport they have had and the treatment accorded them at the club house and the various camps. The club certainly offers great attractions and deserves the fullest success.

Deer Killed in Vermont.

Through the courtesy of Hon. H. G. Thomas, Fish and Game Commissioner, I am able to give the readers of FOREST AND STREAM the official report of the number of deer killed in the Green Mountain State the last ten days of October, which is 754, as compared with 382 in the same period of 1902. This is in addition to the number of does illegally killed, of which reports have been received of 87, which the commissioner says, in his opinion, is not more than one-half the number actually killed. The increased killing is especially prominent in Windsor, Windham, Orleans, and Addison counties, these footing up

178, 43, 64, and 70 respectively. This is accounted for by the large number of non-resident sportsmen who have made their camping grounds in those counties. The small increase over 1902 in Essex county is accounted for by the fact, if reports are to be credited, "that open season continues throughout the year." Four hunters from New York State, six from New Hampshire, two from Rhode Island, one from Canada, and twelve from Massachusetts have been successful in killing deer and taking them out of the State. The number from out the State reported as "not successful" is 68.

The commissioner says "no doubt some of these parties captured deer." Also that "every day reports come to my office that wounded deer are discovered, which means a large addition to the number slaughtered already reported."

From these facts Commissioner Thomas draws a conclusion in these emphatic words: "It is very evident that this increase in slaughter of deer, or even the same ratio kept up, will soon deplete the stock."

Very pertinent comments are made upon "the disposition of a great majority of our would-be good and law-abiding citizens and many wardens to shield one's fellow man who persistently violates the fish and game laws." This is a condition which is not confined to any State, but which prevails quite generally, I believe, in every community. It is in keeping with the observations of your correspondent, who has received numerous complaints from persons who would not on any account go into court and give testimony against an offender.

People who want the game laws enforced do not seem to realize that cases of this sort cannot be successfully prosecuted without evidence, which must be definite and specific. I have heard it stated, for instance, that from a certain town partridges are furnished some dealer in Boston—no information either as to the name of the hunter or of the dealer, and yet the person making the complaint, and who would not give any vital information, wonders why every offense against the laws is not punished.

It is a great gain for the cause to have no open sale in the markets. But persons who desire to aid in the enforcement of the game laws should show less reluctance to give definite and specific information.

CENTRAL.

Pollution of Lake Champlain.

DETAILS of the movement against the pulp mills, alleged to have been polluting the waters of Lake Champlain, were printed in FOREST AND STREAM last July, and the leading New York City dailies took the matter up and have since given to it wide publicity. Prof. Olin Landreth's report was awaited with keen interest, as it was reported that it would surely be condemnation, and that as a result the mill owners would have to find some other method of getting rid of their refuse than by dumping it into the waters of the lake.

Such a report would affect not only the owners of the pulp mills, but scores of mill owners all over the State; who, on the authority of Dr. Daniel Lewis, president of the State Board of Health, have for years been violating the law in this particular. For some reason Prof. Landreth's report was not turned in, and then followed the unexpected descent on the pulp mills by Dr. Lewis, Prof. Landreth and other officials of the health department. Fresh specimens of the mill refuse were taken, and of the waters of the lake and of the rivers on which the mills are situated.

To a representative of FOREST AND STREAM Dr. Lewis stated that the object of the visit was to secure additional evidence, and that no stone would be left unturned to compel the mill owners to live up to the law. From what he observed, Dr. Lewis said that there was little doubt in his mind that the mills were polluting the waters, but before he made any positive statement to that effect would await the completion of the chemical examination of the specimens taken. Dr. Lewis said, furthermore, that like the long continued Barren Island nuisance, which he had stamped out, he intended to end the pollution of the waters of the State by industrial concerns and would direct his first efforts along these lines to abate the much discussed pulp mill nuisance along the borders of Lake Champlain.

A petition signed by leading property holders along the Vermont side of the lake, will soon be laid before the Governor of that State, and as a result it is expected that Gov. McCullough will order an investigation similar to the one made by the New York State Board of Health.

New Yorkers with summer homes about the shores of Lake Champlain, engaged in the warfare against the pulp mills, are congratulating themselves that leading fire insurance companies have allied themselves with the movement. The interest and co-operation of the fire insurance companies in the matter was hastened by the almost complete destruction by fire recently of the newly erected \$40,000 French Catholic church in the village of Keesville, located on the Au Sable River, near where it empties into Lake Champlain. It is declared that the water mains were so clogged with the refuse from the mills that much of the force of the water was lost, and the efforts of the fire department seriously hampered.

The citizens of Keesville, it is said, are indignant against the mill owners, who promised to secure for the village a new source of water supply. The attention of the insurance companies has been called to the case, and if the reports are substantiated, they will either cancel policies or raise rates. They have promised to aid the movement of the citizens and property holders in their fight.

In touch with the movements to stop the continued and further pollution of the waters of Lake Champlain by mill owners, is the probable establishment of a bureau of water inspection and drainage in the State Health Department at the coming session of the Legislature.

In conjunction with this it is proposed to establish a bureau in the department where all data may be filed, and where the public may at any time secure information as to the sanitary condition of any health resort or summer boarding house of any locality in the State.

For instance, suppose a New York man intends to spend the summer in the Adirondacks, and has decided to go to Lake Champlain. He wishes to know the conditions as to sanitation of some particular hotel there. If the proposed bureau were established he could be informed at once of the condition of the hotel. Should the record on file in this department be unfavorable to this particular hotel, it is quite possible that the New York man would not go there.

This measure is not only directed against offending pulp mill owners, but against all persons engaged in unlawfully polluting the waters of the State. The work will be undertaken at once if the Legislature will make the necessary appropriation. The businesslike methods of Dr. Lewis in his investigation of the offending mills are receiving high praise, and strong hopes are entertained that he will speedily bring the matter to a positive decision.

"The matter of the pollution of the waters of the State by mills, factories and so on," said Dr. Lewis yesterday to a FOREST AND STREAM representative, "is a very broad one, and there are many conflicting interests. However, the law on the subject is quite explicit and I intend to bring into play all the power of the Health Department against all such offenders. As a result of the measures which I intend to take, I believe that in a few years time mills all over the State, instead of dumping their chemical refuse into the rivers, streams, lakes, etc., will all have adopted disposal plants of one kind or another, and thus end the evil."

Mr. Hatch stated recently that he had been advised by legal counsel that the polluting of the waters of the State was a criminal offense, and that steps would be taken to call the attention of the local grand jury to the matter, and that an indictment of the mill owners may follow.

Pointer Club Trials.

THE Pointer Club of America's trials fixed to be held at Holmdel, N. J., commencing November 16, were abandoned after two attempts to run on Monday and Tuesday, on some grounds beautiful to gaze upon, but barren of birds. Whoever selected the grounds had a perfect eye for the higher agriculture, but a wretchedly poor eye for the requirements of the pointer club's trials. A large part of the grounds was devoted to stock farms, and fully 90 per cent. of the grounds was so short of cover that a quail could not hide nor obtain a square meal in it. The small part which had cover was so dense or unfit that no competition could be held.

There was a good attendance of spectators, among whom were the president of the club, Mr. R. A. Fairbairn, of Westfield, N. J.; C. B. Seeley, Bridgeport, Conn.; Dr. James S. Howe, Boston; C. F. Lewis, New York; C. Roger Smith, Middletown, N. Y.; John J. Young, F. Reily, De Luther J. Tuny, Philadelphia; Alfred Cox, Hawthorne, N. Y.; Jos. D. Green, Syracuse, N. Y.; R. K. Armstrong, Harrington Park, N. J.; Messrs. E. E. and W. P. Taybor, Long Branch; Howard B. Rathbone, New York; E. W. Throckmorton, Red Bank, N. J.; W. P. Austin, Mansfield, Pa.; J. M. Taylor, Rutherford, N. J.; Dr. A. G. Terrell, New York; Henry T. Rogers, Water Mill, L. I.; Walter D. Steele, Rockingham, N. C.; J. C. Schuyler, Salisbury, N. Y.; F. E. and G. S. Raynor, Riverhead, N. Y. Mr. T. Forman Taylor, seventy-one years old, one of the pioneers in the world of the hunting dog, was present.

The judges were Messrs. G. Muss-Arnolt and B. Waters.

Bad rainy weather prevailed on Monday morning, and in consequence the start was delayed till after lunch. The competition began with the Derby, which had three starters. Two guides, not wholly inanimate, yet almost wholly ignorant of the grounds, were supposed to do the guiding. They were simply incumbrances, and the party would have done much better without them. There were three starters in the Derby. They were cast off on a beautifully smooth, closely-grazed field where at a glance it was apparent there were no quails. The first brace was W. P. Austin's Lady Lou and H. Ball's Top Notch Cordovan, the former handled by owner, the latter by H. Rogers. Commencing at 1:26 they ran to 1:59. Geo. S. Raynor's Saddleback ran with Cordovan from 2:04 to 2:39. They were ordered to be in readiness if some birds were found during the running of the Members' Stake, which was forthwith begun. Two braces were run, namely, Geo. Raynor's Champ with W. P. Austin's Tioga Sam, and Dr. Daniel's Woolton Game II, with W. P. Austin's Blackstone. They ran from 2:42 to 3:54, when the competition for the day ended without finding a bird.

Tuesday morning was cloudy and rainy. An early lunch was eaten, and a start was made. The dogs were cast off at 11:50, and the competition ended at 2:40. Four braces were run, namely, Dr. Daniel's Joe Gray against Geo. Raynor's Brownie; Dr. Daniel's Woolton Dick against Dr. Terrell's Hero; R. E. Westlake's Sam's Mars against Dr. Daniel's Cornish Chief; Dr. J. S. Howe's Baby Keish against Alfred Cox's Fair Acre Ben.

No birds were found. In one heat the "guides" landed the party back in town. They disliked, apparently, too long a distance from the hotel.

The judges decided that it was an impossibility to decide anything. Not a bird had been found, consequently there was not a dog which had done any bird work. To have selected dogs on speed alone would have been arbitrary and in contravention of the purposes of the competition. The competition was declared to be on quail,

and as not a quail had been found, it was no trial. At all events, no decision could be rendered under the circumstances. The secretary called a meeting of the club, and the views of the judges were unanimously sustained and commended. The club decided to postpone the trials till December to be held in North Carolina if suitable provision could be made for them.

On Monday evening an impromptu bench show was held. The judges were Major J. M. Taylor, Messrs. G. Muss-Arnolt, and B. Waters. There were three classes, light weight dogs, heavy weight dogs, and open class bitches. There were seven light weight dogs, of which first went to Blackstone, second to Champ, third to Joe Gray. The other contestants were Fair Acre Ben, Top Notch Tobie, Cornish Chief, Rap of Jingo. In heavy weights the winners were: First, Tioga Chief; Second, Top Notch Launcelot; Third, Sam's Mars. The others were Browne, Nero and Schuyler's Rip Rap. There were three bitches, which won in the following order: Bessie, Bang Bang II., Top Notch Jingolette, and Fair Acre Fay.

Agricultural.

HEMPSTEAD, L. I., Nov. 16.—*Editor Forest and Stream:* Will you kindly give publicity to the inclosed letter, which, I am sure, will be of the greatest interest to your Canadian readers, as well as to all our show-giving clubs which have not, hitherto, been considered "agricultural associations."

JAMES MORTIMER, Superintendent.

[Copy.]

TREASURY DEPARTMENT.
OFFICE OF THE SECRETARY.

Division of Customs.

Washington, Nov. 11, 1903.

The Collector of Customs, Plattsburg, N. Y.

SIR:—The Department has considered the letter of Mr. George de Forest Grant, President of the Westminster Kennel Club, dated New York the 30th ultimo, addressed to you, in the matter of the free entry of dogs brought to this country for exhibition at kennel shows.

Paragraph 474 of the tariff Act of July 24, 1897, provides for the free entry of—

"Animals brought into the United States temporarily for a period not exceeding six months, for the purpose of exhibition or competition for prizes offered by any agricultural or racing association; but a bond shall be given in accordance with regulations prescribed by the Secretary of the Treasury;"

and the Department has heretofore held that a kennel club was not an agricultural or racing association, and therefore dogs could not be admitted to free entry under this provision of law.

Upon reconsideration, the Department is of opinion that under the generic definition of the word "agriculture," an association devoted to the breeding of thoroughbred dogs and the improvement of the different breeds, may fairly be considered an agricultural association, and that upon the importation of dogs for exhibition or competition for prizes offered by bench shows, same may be admitted to entry under the above provision of law.

Respectfully,

(Signed) H. A. TAYLOR,
Assistant Secretary.

Russian Wolfhound Club of America.

NEW YORK, Nov. 18.—It is my duty and pleasure to inform you that at a meeting held at the Brooklyn Bench Show, Thursday, Nov. 12, 1903, the exhibitors and others interested in the Russian wolfhound, organized a specialty club for the amelioration of the breed, to be known as the Russian Wolfhound Club of America. An executive committee, consisting of Dr. J. E. DeMund and James Mortimer, together with the undersigned, was appointed to frame a constitution and standard, to be passed upon by the club at a meeting to be held at Madison Square Garden at 9 o'clock P. M., Wednesday, Feb. 10, 1904, during the show of the Westminster Kennel Club. The purpose of the club is to place the Russian wolfhound, both as a working dog and as a "chien de luxe," first in popular esteem among the larger breeds of dogs. To this end better classification and special prizes from this and foreign countries are already being arranged for for the winter shows. Applications for membership will be gladly received by

JOSEPH B. THOMAS, JR., Secretary.

Yachting.

Designing Competition.

\$225 in Prizes.

Two designing competitions have been given in FOREST AND STREAM. The first was for a 25ft. water-line cruiser; the second was for a 15ft. one-design class. Both competitions were very successful. The great interest taken in those competitions has prompted us to give a third one, open to amateurs and professionals. The prizes which will be given are as follows:

First prize—\$100.

Second prize—\$60.

Third prize—\$40.

Fourth prize—\$25, offered by Mr. Theodore Zerega for the best interior plan.

The designs are for a yacht conforming to the following conditions:

I. Centerboard cruiser, 40ft. l. w. l.

II. Boat must not draw over 6ft with centerboard up.

III. The lowest freeboard to covering board must

The design must be modern in every particular, without containing any extreme or abnormal features. The conditions have been made as simple as possible, that competitors might have all latitude and scope in working out their ideas. We wish to produce an able and comfortable cruising boat, one that shall have ample accommodation for two or three men living aboard for a period of several months, and one that can be easily managed at all times by two or three paid hands. The draft is restricted to 6ft. in order that the boat may have access to nearly all the desirable harbors, and may, thereby, widely increase her cruising field.

Drawings Required.

I. Sheer plan, scale $\frac{3}{4}$ in.=1ft.—showing center of buoyancy, center of lateral resistance and center of effort of both rigs.

II. Half breadth, scale $\frac{3}{4}$ in.=1ft.

III. Body plan, scale $\frac{3}{4}$ in.=1ft.

IV. Cabin plan, inboard profile and at least one cross section, scale $\frac{3}{4}$ in.=1ft.

V. Two sail plans, scale $\frac{1}{4}$ in.=1ft.; one as a yawl; one as a pole mast sloop.

In the case of the yawl rig the position and height of the mast and length of gaff are to be the same as in the cutter rig. Plans must show working topsail and size of light sails.

VI. All ballast outside on keel except amount necessary for trimming.

An outline specification must accompany each design. The drawings should be carefully made and lettered. All drawings should be on white paper or tracing cloth in black ink. No colored inks or pigments should be used. The designs must bear a nom-de-plume only, and no indication must be given of the author. In a sealed envelope, however, the designer must inclose his own name and address, together with his nom-de-plume. All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, not later than March 1, 1904. All drawings will be returned, but postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all of the designs.

Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, who passed upon the designs submitted for the 25ft. with great care, has again consented to judge the designs and make the awards.

THE members of the White Bear Y. C. are to make a supreme effort to win the Seawanhaka cup next summer. Four trial boats are to be built. One will be designed by Mr. B. B. Crowninshield and a second by Mr. Charles D. Mower. These two boats will probably be built in the East under the superintendence of the designers. The other two boats will be Western productions. Jones & La Borde will design and build one and Gus Amundson will turn out the other. The Crowninshield boat will be an improved Massasoit, a boat the White Bear men all thought well of. Mr. Mower will turn out an improved Seeress, which boat did remarkably well on White Bear Lake, after she received bilge boards. Jones & La Borde will turn out an improved Tecumseh. All the new boats will be fitted with bilge boards. A committee has been appointed to look after the four boats to be built, and no detail will be overlooked that will tend to make the boats as near perfect as is possible to get them.

Boston Letter.

BOSTON, Nov. 22.—Probably on account of the unsettled condition of affairs in regard to new rules and new restricted classes, there is not nearly as much activity in the production of new boats in Boston and vicinity as is usually shown at this time of the year. The builders are fairly busy, but the work is being principally done on cruisers, steam yachts and gasoline launches. This falling off in the production of new boats for the restricted classes is only natural, however, and there is a feeling of confidence among the yachtsmen that a reaction will soon be observed. The types of boats that have been built during the past two seasons for the restricted classes have become so radical that it has been found absolutely necessary to change the rules. This has been brought about by the introduction of new classes, the restrictions governing which have already been published in FOREST AND STREAM.

The establishing of these classes has brought about practically a revolution in the makeup of the rules of the Yacht Racing Association of Massachusetts. And thus it is, as is always the case when complete new classes are adopted, that the yachtsmen are not in any great hurry to build. It only takes a few new boats in Massachusetts Bay, however, to get the others in the same classes started, and that is why there is more or less confidence that next season will find reasonably good representation at the open events.

It is only in the smallest of the new classes, the 15ft. class, that there has been any tendency to build boats up to the present time. Mr. E. A. Boardman has an order for one of these boats for Mr. C. Keith Pevear, a Boston young man who summers at Annisquam. Mr. Pevear gives promise of being very clever at the helm. He was very successful last season in sailing Ventum of the Annisquam Y. C. one-design dory class. He is coming up a little higher in tackling the new class, his boat for which will be called Ventum II., and it may be that before many seasons he will rank among the cleverest of the amateurs

in Massachusetts Bay. Mr. Boardman has another order for a 15-footer for a yachtsman who wishes to remain unknown at present. Messrs. Burgess and Packard have an order for one 15-footer, and Mr. Fred D. Lawley is said to have orders for three; but in all of these cases the names of the owners are withheld. It is understood that Commodore H. H. Wiggin, of the Annisquam Y. C., is desirous of going into the class, and it is more than likely that one of Mr. Lawley's orders is from him.

As yet not a single order has been heard from for the 21ft. class and nothing has been heard from for the 30-rating class. With the 30-rating class it is not to be expected that any new boats will be started, however, for the rules have not yet been completed. When the adoption of this class was being discussed, it was found that it would be absolutely necessary to change some of the conditions. The whole ground will be gone over carefully, so that when the changes have been presented, the rules will be in such shape that yachtsmen who desire to may go ahead on the construction of new boats. It is not to be expected that there will be many new boats built for the class, on account of the system of measurement and rating being entirely new in local waters; but should the boats turn out all right, it is possible that the class may become popular.

For the new 21ft. class it looks as though everybody is waiting for somebody else to start the building movement. Mr. Charles Francis Adams, 2d, has already ordered an 18-footer to be designed by Mr. E. A. Boardman. From the fact that Mr. Adams has gone into one class, after having drawn up rules and restrictions for another, it cannot be claimed, by any means, that he is inconsistent. Mr. Adams was not the agitator of the new 21ft. class, but drew up the rules for it at the request of those who wanted the class formed. He is perfectly neutral in the matter of 21-footers, and for that reason the rules governing the class are likely to give more satisfaction than if they were drawn up by men who intended to build boats.

A number of yachtsmen who sail mostly in Marblehead waters have been interested in the formation of a one-design class of 18ft. knockabouts, and it is for this class that Mr. Boardman was commissioned by Mr. Adams to turn out the lines of a keel boat. The model made from these lines shows a nicely turned boat that will sail well in all weathers. Vice-Commodore C. H. W. Foster has ordered a boat to be built from these lines, and it is now thought that three or four more will be built. The model is built to conform to the restrictions of the Eighteen-Foot Knockabout Association, and it is expected that the boats will follow the Y. R. A. circuit of open races, besides participating in impromptu scraps as a one-design class.

Messrs. Swasey, Raymond & Page have orders for a 50ft. cabin cruising launch, a 40ft. cabin launch, a 55ft. waterline auxiliary schooner, a 30ft. speed launch, and a 33ft. automobile launch with a guaranteed speed of 18 miles an hour. They also have an order for a 99ft. steel steam yacht for Mr. Brown, of Pittsburg, to have a speed of 20 knots. This yacht is now being built at Lawley's.

Messrs. Burgess & Packard have orders for a 35ft. launch for Mr. A. H. Chase, of Providence, R. I.; a one-design class of 15-footers for Cape Cod, and a Y. R. A. 15-footer.

Messrs. Wilson & Silsby have received orders for complete suits of sails for the following yachts: Senta, Mr. Thomas M. McKee; new auxiliary schooner Intrepid, Mr. Phoenix; auxiliary schooner Onas, Mr. W. H. Alley; Heron, Mr. W. B. Badger; Dilemma, Mr. L. A. Fish; Spindrift, Mr. David Dunlop, St. Petersburg, Va.; Mavis, Mr. W. M. Lovering, and 18-footer, Mr. E. R. W. Burgess, Jamaica, W. I. They also have an order for ten suits of sails for 18-footers of White Bear Lake, and a mainsail for Mr. B. C. Williams, of St. Petersburg, Fla.

JOHN B. KILLEEN.

Ocean Racing on the Pacific.

To show what sort of racing the yachtsmen around Honolulu engage in, the following extracts from a letter may prove interesting. The letter is from T. W. Hobron, owner of the sloop Gladys, built at Tiburon, and subsequently taken to the islands. Several of the yachts mentioned in the letter are well known to San Francisco yachtsmen. That the Gladys is a fine sea boat is proven in the description of the races, which were around the island of Oahu, on which Honolulu is situated, a distance of 102 miles. The race was between the La Paloma, Gladys and Helene. In part the letter is as follows:

"We arranged the race to leave off Pearl Harbor Bay Friday evening. The Paloma at once romped away, but we held on to the Helene until after the moon set. She was then abeam and way to leeward. We saw nothing of the Paloma until next morning at daylight. As usual with the two big boats, they were loaded below the Plimsol mark with professional talent, the Paloma carrying two native skippers, who had run schooners to Waialua for years. We thought we would perhaps be 'up against it' with such a crew, for we never carry professional pilots. I had two others for crew, but, poor boys, they got terribly sea sick. This is the sort of weather the Gladys has her giant competitors at a disadvantage, especially during darkness. They never dare to sail them as we put the little craft into it, but 'nurse' them in the heavy seas. At 2:57 A. M. I had the special light off Waialua abeam within our agreed two-mile limit. We then stood out to sea and laid off and on until daylight. It seemed a long wait, and I had to keep a careful lookout for the other boats, one of them carrying no lights. I wanted to lower the mainsail and set the storm trysail, and heave to comfortably, but my crew were too miserable to work."—San Francisco Bulletin.

Book Received.

"Earth's Enigmas." A book of animal life by Chas. G. D. Roberts, with fifty-one full-page plates and many decorations from drawings by Charles Livingstone Bell. Small quarto, decorative cover. Price, \$2. L. G. Page & Company, Boston, Mass., publishers.

HAULING IN AN EIGHT-INCH HAWSER.

"A SIX THOUSAND POUND ANCHOR WAS HANGING."

A Few Days Off Shore.

BY F. L. ENO.

I CAME ashore from the Dingley early one Sunday morning, hired a man to set me across to South Portland, and climbed up the ladder and over the rail of the five-masted schooner Jennie French Potter, of New York, which lay in the mud with her bowsprit over the wall. The decks were deserted, but as I stood undecided, the steward poked his head out of his galley door and hove a bucket of water on deck.

"Anybody awake, steward?"

"No, sir. Ole man ain't come up yet."

"Was he expecting anybody to-day?"

"He ain't said nothing to me, sir; was you going with us?"

"Sure. Can you take care of me for a couple of weeks?"

"Lor' bless yer, yes. Looks like you could hold a good deal, too," and the ivories glistened.

"Where's the engineer?"

"He ain't out yet, either. It's about time. The ole man ought to be up pretty soon."

"All right, I'll wait. Now just make that grip fast to this line, will you, please, Mister, and then that camera—easy on that. That's all; you needn't wait. I shall not go back."

The sun was barely above the horizon and that delicious freshness of the new day was in the air; in the harbor the glassy water reflected every spar and buoy, and the quiet was unbroken save by the fussy puffing of the little launch which had brought me across.

I spent a few minutes in a stroll around decks and turned to find the captain at my elbow.

"So you are here, after all? Well, I expect to go to sea to-morrow night; they are going to clean her bottom to-morrow and I hope to get out at high water. She was pretty foul last trip; would hardly move on the passage up. But bring your things down and make yourself at home. When we get to sea and have this coal dust washed off she will look like something. I'm glad to get out of coal for one trip; can't keep anything looking decent while you have it aboard. So you would like to see some wind? Well you may at this time of year. I do hate to go South in September. You never know what to expect. Ever been in Fernandina? Great place. It's a good, healthy port; best in Florida. But I wouldn't go this trip, only there are so many vessels bound for coal ports ahead of us I am afraid we should never get loaded. We've been here in Portland thirty-eight days now and on demurrage ten days, so I can't kick. But that crowd down there (pointing down the harbor where 50,000 tons of coal lay in twenty or more big four and five-masted) are all on their time and losing money every day. They soak me ashore, tho'. They say, 'Oh, yes,

you are Captain Potter of the Potter. Well, Captain, they say, you are making money like everything laying here. Guess you can pay for that all right. Come down.'"

The Jennie Potter is one of the monster five-masters that are coming into favor so rapidly, and is considered a flyer. Built in Camden, Maine, in 1899, she is practically a new vessel; and having been painted on the last trip, looked like a yacht, despite the marks of cargo. As far as I was concerned she was a yacht, and this was a yachting trip, and on a big scale. Of 1,794 tons measurement, 279ft. on top, 44ft. beam and drawing 24ft. loaded, she gave her master all the trouble and care he wanted when on the coast or working over the shoals; and the prospect of a trip in her at this season of the year when there might be something doing was highly pleasing.

Sunday, Sept. 13, was the first of three extremely hot days, and I divided the time loafing on deck, going in swimming in the harbor from the small boat and taking a few snapshots, besides lending a hand when so inclined at any pulling and hauling that was going on. Needless to say, we did not get to sea at the expected time.

Alongside of us, over on her side, lay the hull of an old Italian bark, the Adele, which had put in at Rockland the last winter, and after various mishaps, getting ashore and leaking, had been towed here and run on the mud. It was the old and the new in contrasting juxtaposition; the poor little, old, stranded bark high-sided and slow, and the magnificent new schooner, the exponent of Maine's famous industry, which could have stowed the old bark in her hold.

Monday morning a gang attacked the sides with brooms and scrapers, and the second mate and I got the sail covers off, rolled up and stowed away, while the captain went uptown to finish up some business.

The engine man, with whom I had sailed before, was a bright young fellow from Down East, who had been in the schooner since she was launched. He had hoisted her masts in at Camden, and when the immense foremast, weighing many tons, was hanging over the engine room, where he was standing at the lever, his first work as an engine man, he began to think of things which happily did not occur.

The second mate, a stocky, muscular German, who proved to be the best man in the ship, had just come aboard, having left the barkentine, Jesse MacGregor, which lay alongside. "We pumped all der passage," explained in full the reason for his change; and one glance at the little old hooker confirmed the justness of his choice.

The steward, a colored man of about fifty, was a deep-water cook, who understood his business, as appeared later, and for neatness and skill had few equals.

The mate, a Dutchman, who could barely make himself understood, was half sick and doubtful about go-

ing, but he hated to leave and was a good man, as the neat appearance of paint and bright work and rigging proved.

About 11 o'clock a hail came from the dock, and the steward looked over the rail.

"Here come my dogs," with a rich, mellow chuckle, "I'll feed 'em well to-day; start in right, you know."

The sailors dragged their dunnage in a motley collection of bags and boxes into the hole at the forward end of the forward house, which was to be their home for the next month or so. It at least furnished shelter. The big donkey engine occupied the after and greater part of the forward house, and the temperature of both places was far from agreeable. After dinner the mate came aft.

"I wish you would go ashore and see if you can find the capen and tell him to come aboard as soon as he can. The men won't turn to and want to go ashore. You take the boat and pull across."

I started for the ladder, but two of the men were coming aft dragging their bags after them. When they saw me they dropped the bags and ran for the rail, but I got there first, cast off the painter and was halfway down the ladder when their heads came over the side.

"Hi, there, mister, set us ashore, will yer?" No reply.

"Mister, put us ashore, please; we want to go ashore." No reply.

"You blankety blank, come back here and set us ashore. Well, good luck to yer," and then followed a few choice remarks aimed at the vessel and her innocent passenger. They stayed aboard.

After a long hunt around town I gave it up and pulled back.

"Well, they have gone," said the mate.

"Gone? Where?"

He pointed to the bow line which stretched taut as a bar of iron from the bow chock to the dock.

"One of them slid down that bow fast and stole a dory and came back for the others. Everybody around was guying them and me. Now you will have to go back and find the old man somehow and tell him he will have to get another crew."

A second trip was more successful.

"Well, that beats all. However, when the tug comes alongside you tell the mate to haul her off the flats and anchor down in the roads. I will come off with another crew."

But no crew came that afternoon. The following day the tug appeared, and on her forward deck a group of six reeling, drunken beasts, cursing heaven and hell and all between, who were helped up the ladder and over the rail, and who immediately disappeared below, where fight and revelry held sway, judging from the sounds that found their way aft. The better part of the day they stayed in or around the fore-castle drink-

AT THE WINCH—"BOSS AWAY."

"TWO REELS"

WASHING DOWN.

"SWAY HIM UP."

ing and howling, and our prospects of getting to sea for a few days began to seem more remote than ever.

Finally the tug returned with the captain, all ready to tow us out, when the mate, as tho' to add another to the many trials of the skipper's life, decided that he was too sick to go and asked to be put ashore. So back again went the captain and tug, and Captain Potter spent a good part of one afternoon of the hottest day of the year in hunting up and capturing a mate; and at last about 4 o'clock, returned with a candidate who, staggering up the ladder, dumped chest and bags and boxes and bundles enough for a cruise to the moon on the deck and disappeared in the forecabin with the sailors.

"Now, Mr. Hubner (to the second mate), pass a hawser to the towboat and tell the donkeyman he can heave away when he wants to. What do you think of that? That man was sober when I signed him. He has been doing some quick work. Never mind, I'll straighten those boys out before we get very far. If you will take the wheel we will get outside and see what we can do."

As I stood at the wheel and steered the schooner after the tug, I pitied that captain, and at the same time admired the nerve that would start to sea with a big schooner and no one to handle her. Here was a vessel worth \$75,000, to say nothing of the passenger, going to sea with only three men out of eleven fit for duty; three men to handle a schooner of 1,800 tons, night coming on and in the hurricane season.

I wonder what we would have done had we had the breeze on that night that we had the following. Gone ashore probably on the rocks at the mouth of the Kennebec and those dogs were getting \$35 a month. Talk about the poor sailor—rubbish—the poor captain and owners come in, too.

How calm and beautiful was that day; the green shores and white beaches shining in the sun seemed the epitomé of peace and happiness; and as the incomparable coast of Maine faded from sight astern I could not but contrast the purity of the world about us with the miserable human element expressed in those sailors forward, who could see no further than a bottle of rum, and who, living in an atmosphere which developed physical strength, were almost rotten with poor whiskey and dissipation.

The immense hawser cast off from the tug was dragging astern; the anchor was hanging from the bows and the sails, loosed, lay on the booms, save the foresail, which had been hoisted part way by the sober ones. The mate was still out of sight, and until their rum was gone it would be impossible to do anything with the sailors. An empty bottle flew over the rail; one step nearer business that meant. At length a few staggered up and began to make sail more by instinct than reason. The messenger was dragged along by men barely able to stand, and with heads aching enough to split, I warrant; though the heave of the vessel as she felt the roll of the open sea, seemed in some degree

to counteract their unsteady gait. All sorts of calls were rung in on the engine man by anybody who happened to think to pick the bell, and the wonder was that the gaffs and booms were not hoisted clear to the masthead. Finally the lower sails were set, and then they tried to get the anchor on the rail.

Nobody was killed, thanks to something which protects fools and drunkards, but when the ring painter had been rove and the anchor hauled up, the whole crowd, with the exception of the second mate, beat a retreat into the forecabin to join in another round of poison, leaving him hanging on for dear life, and nobody to pass and secure the ring-stopper, while a 6,000-pound anchor was hanging at the cathead.

"Mr. Hansen, Mr. Hansen, will you please come and give me a hand with this anchor? Mr. Hansen, won't you send a man to help me with this tackle? Mr. Hansen, Mr. Hansen."

I couldn't help noticing the manner in which the second mate, almost automatically, it seemed, took "Mr. Hansen's" position for all that it implied. Mr. Hansen was the mate, and as such was supposed to have general charge of all operations on board, and, be he drunk or sober, a good man or the worst drunken sot that could get a job as mate, he was the "mate" and in authority; and here was a young man worth six like "Mr. Hansen," looking to him for orders and accepting without question his intrusion over him in the vessel, and ready to jump at the bid of a man who was a stranger to the captain, and picked up at the last minute through necessity.

But Mr. Hansen was deaf to things of so little importance as getting an anchor on the rail. Finally, the second mate called me, and between us we caught a turn, he secured the anchor, the mate and his gang reappeared, and with a steady stream of bad language the shank painter was passed, the mass of metal hoisted on the rail, lashed down, and the job was done. Then a man was sent to each masthead to loose the topsails. I really expected to see them all come down by the air line. What faculty can protect a man aloft who cannot keep his feet on deck I do not know, but they got there, missing a ratline now and then; and after some time the hail came down, "Ready the fore!" "Ready the mizzen, sir!" "Ready the spanker topsail—i—i!" The main was not heard from. After a half hour the mate's befuddled brain grasped the fact that the man at the main could not handle the sail, and he sent another man up to help him. As the second man hauled himself up into the crosstrees, one about as fit as the other, the first one, realizing what was going on, full of indignation, leaning far out over the ratlines of the topmast rigging, thus addressed the mate, who stood on the deck below him:

"What do you mean, sir? Don't you suppose I can loose a topsail? What do you mean by sending this man up here? Do you mean to insult me? If I can get down I will tell you what I think of you."

The idea of that rum-soaked wretch being open to

insult and the expressive "if" were killing.

Leaving No. 2 to try to loose the topsail, No. 1 succeeded in regaining the deck, and rolling up to the mate, started in with a long harangue; but in two minutes they had their arms about each others' necks in maudlin endearment. But the climax came later. The captain ordered the outer jib loosed, and one of the men started out on the jib boom, another followed and another, till five of them were out there doing nothing, when the mate came along and joined the group on the end of the spar. Six men bunched at the end of a jib boom trying to loose a sail that a boy could loose in three minutes, were never seen before. I turned and looked at the skipper. "Well," he said, "I've been going master of a vessel twenty-three years and I never saw anything like that before. I've had drunken crews; you always have them; but when the mate takes hold and joins in I'm done. I'll give that fellow his two and sixpence as soon as I can."

Morning dawned, with a moderate southerly wind, and close-hauled, the schooner made but little progress. We held on the starboard tack, and at dark the wind, which had been breezing gradually, blew a fresh gale, and we reefed the spanker. This is always exciting; when the air that sweeps through the rigging is warm and the rain that beats in your face is warm, and the vessel is light and up out of water, it is not especially dangerous; when the thermometer is at freezing and the loaded craft is awash in the bitter seas, then it is another story. That night it was play. The messenger is passed to the reef tackle and the band hauled taut; then the heavy sail is "skinned" a little at a time until the first line of nettles is reached; but the job is to find the corresponding nettle on the lee side, and with oo canvas, the heaviest made, which resists your efforts to move it like so much sheet iron, it is no easy task to find the right points in the dark. And from a reefing plank bending under the weight of three or four men, you cannot use your strength to advantage.

The schooner was heeled over and pitching in the sea, and the big sail slacked down to the second reef band, bellied out to leeward; the second mate was at the earing astride the boom, and all hands were ranged along the spar while the water foamed along under our feet, and the spirit of excitement possessed everybody. Without steam it would be killing work to handle those big sails, but the invisible messenger along the deck yanks the kinks out of things in a hurry, and with the band as taut as the boom itself, we knot the points and hoist away again. That night we "jogged along." Reports on shore gave it as a fierce gale, but it did not seem so to me at the time. Possibly the vessel was so big that she did not make much fuss in the comparatively smooth water; she lay down under the reefed spanker and four "lowers" and soaked along, not doing much to wind'ard. In fact, I do not believe we made anything to wind'ard; we wore ship several times during the night; she wouldn't tack. These long schooners, when light, are awful things to handle, and

"ELEVEN KNOTS AND BREEZING UP."

CAPTAIN POTTER, OF THE LOUISE E. CRARY, WHO SPENT THREE DAYS IN AN OPEN BOAT IN THE DEAD OF WINTER.

THE SCHOONER LAY ON THE FLATS.

every time we gybed we lost two miles. In the morning a fog enveloped everything, and hung on all day. The lookout divided his time between unavailing attempts to peer through the fog, and the successful operation of the fog horn, which is a box-like arrangement worked by a crank that gives a long, mournful groan, dying away by degrees as the wind in the bellows passes out. We could see nothing and hear nothing; even the end of the jib boom was invisible at times. We were on the port tack heading west, and early Friday morning made Thatcher's Lights, on the lee bow. The wind came out of the N. W., and gave us a good run across the bay as far as Monomoy, where we anchored and narrowly escaped converting a little Nova Scotia schooner into a sloop. Captain Potter, after some hesitation as to the passage of the shoals, had determined to attempt them when the wind fell calm, and with the lee tide running strong we were compelled to anchor; but just before we let go, the little Bonnie Doon of St. John, New Brunswick, choose a location about a hundred yards under our stern as the best place on the coast to anchor; and as we drifted down broadside on with jibs aback, there seemed to be every prospect of a collision. The crew of the little schooner ran around the decks, hardly knowing where to go for safety, and our big bowsprit reaching to his topmast heads, must have seemed a mile long to them. We swung clear by 50ft. and drifted to leeward; we could do nothing on the head tide. A crack fisherman just off the ways, was attempting to beat through the slue of the rip; his white sails, glistened in the rays of the setting sun, and with his black hull newly painted and of the latest model, she looked like a yacht, but for the dories on deck. She tacked again and again with almost the speed of a knockabout, but had to give it up, hauled down his jibs and anchored. I looked at the little Nova Scotia schooner with longing eyes; she had a deckload of wood, and was evidently bound to New York; and if the past few days were a sample of what we might expect in the way of progress, I began to think I had better be getting ashore and leaving the further navigation of the Jennie French to those who had unlimited time at their disposal. Here was almost a week of my time gone, and I did not wish to be away more than two or three at the outside; and Fernandina still 900 miles away.

"What do you think, Captain? Can we make Fernandina in a week?"

"A week? I've known vessels to be thirty-eight days going down at this time of year. You are taking some pretty big chances if you expect to be in Fernandina a week from to-day."

"How about that little Blue-nose; do you suppose he would take me to New York?"

"He may be three weeks getting there himself, and after we came so near smashing him all to pieces I doubt if he would; you had better stick to the ship;

we will have the wind to the norrard to-morrow or I am a Dutchman. Dou you see those clouds in the nothe? That is a sure sign of an easterly. This sou'-wester has hung on for over a month now, and it is near the change of the moon; we are sure to get it within twenty-four hours."

"Well, I'll risk it; but once clear of the shoals there will be no chance to get ashore; so let her blow."

After an hour's delay a light westerly came off the land, and the captain determined to get under way and try the south channel; but the wind was too far to the westward for us to weather Rose and Crown, so about dark we anchored again, hauled down the jibs, settled the topsails on the caps and turned in.

At midnight the tremble of the donkey engine heaving in chain woke me, and I went on deck. The preliminary toilet (slipping into my sneakers) took six seconds. The north wind was blowing strong; the stars were gleaming bright, and the vessel was just paying off and leaning over under the weight of the fresh breeze, which was increasing every minute, and roughening the water as though it meant business. As morning dawned a little three-master, whose lights we had seen to windward for some time, came down on our weather quarter, and steering almost our course, ran alongside of us, slowly drew ahead and crossed our bows within, as it seemed in the half light, a hundred yards or less, and stood off to leeward. Whoever was in charge of that vessel knew his business or was drunk, for a closer shave there could not have been, or

THE PILOT BOAT.

had we not luffed so as to clear him as we did, we would have run over him. It was too dark to make out his name, but he had a new foresail.

We were now fairly on our way, and the watches were set and the routine of sea life begun.

One of the chief factors toward a contented crew aft (forward there is none at any time) is a good cook, and our "doctor" was Al in all that the term implies. His crisp bacon and French frieds and snowy biscuits were a treat; and after two or three hours on deck before breakfast, the sight of the doctor coming aft with his basket on his arm and the steaming coffee pot in one hand, was a signal for a sudden and general movement on the part of the hungry element aft in the direction of the forward cabin, where the neatly spread table awaited our onslaughts. The man at the wheel looked out for the schooner then, and we had to do some lively hustling to get our fill in the fifteen minutes allowed by custom for stowing away the first

BONNIE DOON OF ST. JOHN.

table's supply; for the second mate and the engine man were hanging around in the waist, hungry as bears, waiting for us to finish; and to appetites sharpened by hard toil in the open, every minute spent in waiting within smell of the grub seems an hour.

At 1 o'clock we passed the South Shoal Lightship; they stood by with their flags in case we should desire to send a message, and I was tempted to send home and say that I might be gone even longer than that; but it costs \$5, and if I didn't get back on time they would know I was still away, so concluded to let it go. We were reported by wireless, however, as having passed.

The course was now south by west, and with the grand nothe easter, which promised to last for many days sweeping over the ocean, we began to figure on a quick passage.

The last time Captain Potter came down this way circumstances were somewhat different, and his trip of three days in an open boat in the winter was reported far and wide in all the papers. It will bear repeating here.

In December, 1902, the schooner Frank Palmer, the largest four-master on the coast, and the five-master Louise E. Crary, a comparatively new vessel, and one of the finest of her class, came in collision about eighteen miles off Thatcher's, and both sank at once. Captain Potter of the Crary, who was below when the collision seemed imminent, had just time to reach the deck when the crash came; both fore masts falling

FULL AND BY.

together held the vessels fast and locked in a death grapple, they sank, leaving the helpless crew of the Crary to swim or drown. Captain Potter jumped over the quarter rail, and enveloped in a heavy ulster, swam a hundred yards to the Palmer's boat, which her crew had succeeded in cutting adrift; the Crary's boat was stove to pieces. Then for three nights and days they drifted out by Cape Cod and into the South Channel unprotected save by the clothing they stood in at the time; for three days and nights they froze and starved and died of thirst and crazed by suffering, leaped overboard to reach the fountains that sparkled in the distance. Thirteen vessels they saw, but none saw them, though one passed so close in the night that they could almost touch her side. The fishing schooner Manhas-set picked up those who were left off the South Shoal Lightship and carried them to Boston.

Captain Potter's feet and legs were frozen solid to his knees, and only his most determined resistance to the decision of the surgeons saved them for him. Of the Crary's crew of eleven, only one beside the captain was saved. The two ill-fated crafts, with 6,000 tons of coal and some of their crews, lie in each others embrace fathoms deep off Cape Cod; and as we came across the bar Captain Potter thought at one time that we were about over them.

From the last shoal, over which the seas were breaking white with foam, our course was laid for Diamond Shoal Lightship, off Hatteras. With everything on her and drawing she logged ten knots that day, or exactly 120 miles, between 6 and 6. The water slowly changed its color from the whitish tinge, which showed a depth of only 100 fathoms or so to the deeper hue which marks the "off sounding," area from 1,500 fathoms up; and every mile now that the schooner drove on her course was that much gained, although about here we began to feel the effects of that wonderful "stream" which dominates the North Atlantic and its shores.

The hard work and bracing air of the last few days had served to clear the fuddled heads of the dogs forward, and they turned out to be about the average crew.

The white paint on rail and house had been cleaned and the broad quarter deck, generous in its 40ft. of beam, made a most attractive promenade with the huge spanker boom wide off over the lee-quarter, rising and falling as she rolled. The blue sea and sky, the white-capped waves, the clear, warm sun and the long trailing wake astern that told without the aid of the log which skipped along in the foam of the speed we were making, fully atoned for the delays of the previous week, and it was grand to feel the onward sweep of the big craft as she lifted and seemed to slide along at a pace that kept the dial on the taffrail moving as the miles were reeled off.

THE PILOT COMING ABOARD.

THE PASSENGER STEERED.

Sunday morning had brought a change in the direction of the wind, its strength had increased considerably, and the sun was hidden; flying clouds swept across the sky and the sea had grown to a good size. We had hauled to a point to allow the sails to draw and while thus sailing much faster, still were off our course, and all the time getting into the gulf.

These big five and six-masters will hardly move dead before the wind; then everything forward of the spanker is becalmed, and the spanker itself loses a great deal of its power, as the boom can be squared at an angle of only about 45 degrees with the line of the keel; and the least inattention in steering will have her "by the lee," when you might as well be at anchor. So, strange as it may appear, with a wind blowing fair for your destination, you have to beat down to leeward when a two or three-master would "wing out" and go fluking, and the slightest change in the course is manifest. You may be asleep below, when all at once she begins to roll and slam and bang the booms about with a terrific noise—the man at the wheel has let her go off half a point; then the rolling ceases, she lays over a trifle, the soft hiss of foam comes in at the open port; he has her on her course again and added four or five knots to the speed.

Toward the latter part of the afternoon it blew harder than ever, and the sea became steep and angry; the schooner was wallowing along, rolling and pitching and sending the foam in broad sheets on either bow; a good eleven knots by the log and still breezing.

Had we been on the wind we should have been snugged down to reefed lowers all around, but running before it we could carry on, and the sea that was following us helped out in the speed; though sometimes when she would settle between two seas there would be "seven humps" in the long sweep of deck that ran forward to within a few feet of the forward house. These long schooners work and strain terribly in a steep sea. Many a good schooner, caught out "light" in the Gulf Stream has broken in two, and no skill can prevent it. Say hurricane to one of these big schooner captains and he will shrink back and put up his hands as though to ward off a blow, and they have reason. Running before it as we were, she slid over the seas in a regular rise and fall that gave no indication of the size of them; but as I stood in the waist my eye was on a level with the long poop-deck, and when the stern settled in the hollow and the next sea getting under, rose around the quarter, I could see that deck curl up; and then as the sea passed under her and she hung on it amidships, the ends of her dropped, and along in the wake of the mizzen mast the deck humped up and hogged; and as the stern settled she straightened out, curled up, straightened out, curled up, and straightened out.

A bank of clouds in the southeast, which had been hanging there all the afternoon, seemed suddenly to rise and draw near with an advance which could be felt in the damp, cold currents of air which occasionally found their way into the warmer atmosphere about us. Clearly defined against the sky and rapidly rising as though another half hour would find us buried in its blackness, it approached, and extending to the east until we were well by, the end of it seemed to lie in wait for the proper moment to strike or engulf us in its arms. The mate, whose head was even yet none too clear, after walking uneasily back and forth watching the cloud and the sails and the course, and showing his nervousness in every motion, finally stepped to the companionway and spoke to the captain, who had gone below for a wink of sleep. A word at the companionway will bring any shipmaster, however soundly sleeping, on deck in about eight seconds, and in that time the captain was up and looked the question he did not ask. The mate pointed to the fearful looking clouds and blackness to leeward and suggested that it foreboded no good.

"Oh, that's nothing, I guess. Looks like a lee set for a nothe easter. How is she heading? (Aside) The idea of calling me up for a thing like that. I'll give that feller his papers as soon as I can, now, don't you forget it. I'll be mighty glad when this trip is over. Might as well sail with nothing at all as with that for a mate. There won't be a whole sail on the ship by the time we get to New York if he stays aboard." And that was true enough, for on the first night out the mate had torn about every topsail in setting it. The winch at the side of the forward house would be winding up the messenger at a rapid pace and the halyards fast to it would be "two blocks," and everything stretching and snapping and settling under the strain and the topsails as flat as a board, when the mate, if he happened to think of it, would blow his whistle, the man at the winch would pick the bell, and the engine would stop—but between the time of the mate's appreciation of the fact that things were swayed up taut and the stopping of the power, a period of a few seconds necessary for the transmission of the signals from the mate to the man holding the turn, and from him to the engine man, the damage would be done, and a split would appear at the head of the topsail or staysail, or whichever part caught it the worst, and if it was dark, the limit seemed to be when something carried away entirely and came tumbling down on deck, and when a few days later, after supper, the mate came aft, with unmistakable signs of a drop too much, I expected to hear something. But nothing was said, though I confess I did not relish the idea of that big ship tearing along in the night with nobody in charge but a man who couldn't have told Diamond Shoal Lightship from a drug store.

The captain of a vessel cannot stay awake every hour of the day, and if his mate is incompetent luck must take charge at some hours; and luck is not always good.

At eight bells we gybed her over; and aside from handling the spanker boom, that operation is not difficult; but the spanker boom supplies any deficiency that may be lacking in the others in the way of quick work. Imagine a spar 70ft. in length by 22in. in diameter stretching a sail whose weight is a half ton when dry and whose pulling capacity when distended by a small gale, cannot be measured. To get that boom amidships and over the other side without mishap to anybody or

anything, is a good job when it is blowing. We gybed over repeatedly on the passage down, about every four hours at the call of the watch when all hands were on deck; and one night, as the boom went over, the sheet fouled the wheel-box, cut in under the cover, and lifted it like a great white ghost flying across the deck. From the time the messenger is passed and the big boom comes slowly in until the sail gets aback and the tackle is snubbed as the spar flies overhead snapping and buckling under the strain and twisting the mast as it digs its jaws into it, there is always a chance that something may go wrong—and then stand by. This time we slacked down the peak halyards, and had our hands full in overhauling the lee sheets and keeping everything clear.

Soon after supper we reefed the spanker again, and made a quick job of it, compared with the first night back in the bay; the sail seemed to fall so that the nettles came handy, and I doubt if we were over fifteen minutes from start to finish.

Topsails and staysails and the outer jibs had been furlled, and at midnight they gybed her again. I was asleep at the time, and thought I should be shaken out of my bunk as the boom tackle was slacked away. The whole vessel trembled and shook, and I came on deck to find a small gale blowing and a big sea running and getting bigger. The ship was under the four lowers and a reefed spanker doing thirteen knots. It was grand sailing. Running quartering, she rolled down until, light though she was, you could almost reach the water to leeward; and the schooner that on the flats at South Portland was called the "big five-master," looked no larger than a fisherman. But how she steered! Instead of the soft almost human pull of tiller ropes, there was a double gear, which it took the strength of one man to move in smooth water, and to put the wheel up or down in a hurry, took two men; and it was a dead pull—no "give" at all. How the Dutchman used to curse that "dommed whheel."

The breeze came, a steady, howling flow that sent us through the water with an area of phosphorescence on either side. We were about on the edge of the stream with the gale against the current and the water was anything but smooth. Two hundred miles inshore, along by the capes of Delaware, the northeaster was sinking ships and lifting houses off the ground, but either we did not feel the full effects of its strength, being on the edge of it, or running before it, did not mind it. I did not realize at the time that it was anything more than a strong breeze, although I was surprised a few days later, when the wind had fallen a great deal, to see vessels bound north under short sail and hove to. I went below about 2 o'clock, and after rolling in the berth until sleep was out of the question, finally slewed around athwartships, dug my toes into the outside board of the bunk, braced up against the side and so stayed in.

At meal times we did some lively catch as catch can exercise, to prevent numerous dishes from sliding to destruction, in spite of the rack which the steward had put on the table. As he said with a look of disgust when the tomatoes left their dish and spread over the cloth, "she allers rolls worst at meal time." But years of practice in all the seas of the world had made him a master hand at preserving his balance and his temper; and with the arm and chest of a Hercules, he made play of work, and with the good humor of his race could spin yarns of the China seas or the California coast.

At midnight we gybed again, hauled in out of the gulf and into much smoother water, and with a glorious breeze swept along with everything drawing, and the reefs out of the spanker. It was much warmer, and by the log we should make Diamond Shoals by dark, and after a few casts of the lead it appeared dead ahead—a good shot after shifting the course so many times.

"A nothe easter like this," said Captain Potter, "generally lasts way down below Hatteras. I've known it to blow for eighteen days just like this—when I was bound the other way. We ought to be in by Wednesday night."

South of Hatteras it is always summer; the water was warm, the sun burning hot, and the sea fairly smooth. From Diamond Shoals the course is S. W. by W., which takes us clear of everything and does away with the gybing, of which we had had so much, and we sailed along at steamer speed. For the space of twenty-four hours we touched neither sheet or halyard or tackle, nor shifted the course, or slacked our speed; ten knots we averaged that twenty-four hours, which meant 240 miles and more, for the mighty gulf, instead of being against us, was in our favor in its eddy, and that day about noon the smell of the land strong and rank, came off on the wind—the smell of the marshes and swamps of North Carolina.

That night was an ideal one. The wind came sweeping into the sails in a warm, steady, generous flow which promised to last forever; the bright stars overhead gave light enough to make out objects about decks; the great arching sails, swelling hard, seemed like the wings of some gigantic bird overhead; and the staysails, like handkerchiefs aloft, looked like mere toys that a boy could trim down; take a pull at that staysail sheet and see if you can start it; a half dozen men couldn't gain an inch on it. The whole structure, clear cut against the brilliant sky, made a picture that cannot be transferred to canvas or plate; the soft air and onward sweep; the hiss of troubled waters; the faint creak of block and gear; the sharp snap of straining hemp; the dull roar of the wind rushing under the booms and through the rigging; the regular heave of the deck and the outdoor living magnetic thrill of it all—all these can never be told or pictured; they must be lived and felt; and a few days and nights like these are worth a month of stuffy walls and soft living.

At noon several schooners appeared under our lee, and we judged we were in the latitude of Brunswick. One of them, a large five-master painted white, one of the Palmer fleet, passed close by, and answered our hail. Toward afternoon the wind showed signs of failing. But it had served us well. From the moment we got our anchor at the foot of the shoals off Monomoy it had blown strong and steady until we entered

the river at Fernandina entrance; where, as though its duty done, it flattened out to nothing. For a distance of 900 miles we had averaged almost nine knots—a very quick passage.

The water had changed its color to a dirty light brown, and about 4 o'clock a pilot boat rounded to under our lee, and the pilot came aboard. One hundred and fifty dollars for pilotage, \$350 odd for towing out, sailors getting \$35 a month and cook \$55, freights going down and winter coming on—but this was my yachting trip.

Ice Boating on the North Shrewsbury.

Editor Forest and Stream:

If the winter of 1903-04 is favorable for ice yachting, the racing promises to be of the most interesting character on the North Shrewsbury River, at Red Bank, N. J. Besides the usual club races, there are challenges from the South Shrewsbury and the Pleasure Bay clubs for the third class ice yacht pennant of America, and from the Burlington, N. J., Club for the State pennant. The North Shrewsbury Club has also challenged the South Shrewsbury Club for the Shrewsbury River pen-

ICE BOAT TYRO.

nant, captured in 1901 by the latter's yacht Leroy. All of these events are open only to yachts carrying not more than 350 sq. ft. of sail. Local conditions have favored the building of ice yachts of this size, and there has come to be practically no racing in any other class, although there are yachts on the river carrying from 200 to 900 sq. ft. of sail, covering all classes from first to fifth.

The third class includes some fourteen yachts carrying from 250 to 350 sq. ft., most of them being built

ICE BOAT TYRO.

right up to the maximum limit, and arranged largely for racing. The lateen is the favorite rig, although there will be two modern jib and mainsail rigs in the third class. One of these, the Atalanta, the property of Newton Doremus, appeared at the end of last season in one race, and by its performance filled her owner with great expectations. The Georgie, which has heretofore had a lateen sail, is to be changed to jib and mainsail, with about 300 sq. ft. of sail, which, in connection with her light weight and narrow track, 13ft., will make her a fast light wind boat. Chas. P. Irwin, the Georgie's owner, is also building a new lateen up to the limit, and is devoting all of his well known skill as an ice yachtsman and builder to making a fast and workmanlike boat. It is to be equipped with two planks, tracking 15ft. and 17ft.

In 1902 George Gillig's Wizard, built by Robert Chandler, was clearly the fastest ice yacht on the North Shrewsbury, but last winter her title to champion was not so clear, having been defeated by both

the Daisy, which is a light wind lateen and by the Georgie and the Vixen. Yet she won more races than any other.

Grant and Morford's Tyro came out last winter, and for a new boat performed creditably, taking part in ten races and usually being well up, but not a winner above second. Tyro is a thoroughly workmanlike job, and has this summer been furnished with two sets of runners, and in other respects has been put in improved shape for racing.

William White is building the Mistral, a lateen of about 350 sq. ft., whose characteristics are a very lofty sail and an unusually wide plank, 18ft. track.

Dr. W. B. Brewster is at work on a steel ice yacht which embodies some novel features. The runner plank is a bow string truss of about 15ft. spread, and the keel is of the "what is it" type. Everything is steel or iron, except the sail, which is being made by Wilson & Griffin. The side runners are of steel, 6ft. straight bearing on the ice, and all runners are to work together from the cockpit. Sheer poles and spars are all galvanized iron pipes.

Besides the above mentioned ice yachts, there are other creditable third class yachts which may be improved so as to get up with the leaders.

The usual width of beam is 15ft. track for boats of about 346 sq. ft. of sail, but the tendency is to increase the beam, as riding the plank is not allowed, and some dependence must be placed on beam and lead ballast for the average winter breezes.

The Scud and Dreadnaught of the first class are at Kalamazoo, Mich., awaiting the regatta, proposed last winter; the Rocket, also first class, is to be transferred to the Pleasure Bay Club; the Edna M. and the Get There, second class boats, are outclassed by the newer third class. The Witch, owned, built and sailed by Captain Charles Burd, of J. R. Maxwell's 70-footer, the Yankee, is the fastest fourth class boat. The combination of Burd and the Witch is hard to beat, even when racing against the boats of the third class.

T. H. GRANT.

RED BANK, N. J., Nov. 12.

Robin Hood.

THE picture of Robin Hood, which appears in this issue, was taken just as she was crossing the finishing line a winner in the 25ft. class in the annual race of the Indian Harbor Y. C. on Aug. 8 last.

Robin Hood was designed by the clever Boston amateur, Mr. Charles H. Jones, and was built by the Geo. Lawley & Son Corp. at South Boston, in 1898. Mr. George E. Gartland, the boat's present owner, purchased her in 1899, and has used her continuously ever since. She is 32ft. over all, 21ft. waterline, 10ft. 4in. breadth and 3ft. draft. Her sails were made by Messrs. Wilson & Silsby, of Boston.

Robin Hood was champion of her class the year she came out. In 1899 she was raced in the raceabout

ROBIN HOOD.

Owned by George E. Gartland.

class, but since then she has been in the 25ft. class. During the past two years Mr. Gartland has not raced Robin Hood, except in the open and handicap contests of the clubs of which he is a member, viz., the Indian Harbor and Riverside. Robin Hood is at her best in strong breezes, as her moderate sail area of 593 sq. ft. is hardly sufficient to drive a boat of her large displacement at any great speed in light weather. Robin Hood is an exceptional cruising boat, having both large deck, cabin and cockpit room.

On Aug. 7 last Robin Hood beat the champion Firefly 4m. 59s. over a 10 nautical mile course in a strong N. W. breeze. On the day following she again beat Firefly 3m. 18s. in a fresh to strong breeze. In both these races she beat all the raceabouts on elapsed time except Hobo.

L. M. Y. A. Annual Meeting.

THE Lake Michigan Yachting Association held its annual meeting at the Wellington Hotel, Chicago, Saturday, Nov. 14. The officers elected for the ensuing year were:

President, E. P. Warner; First Vice-President, Geo. R. Peare; Second Vice-President, R. B. Brown; Secretary, Charles Scates; Treasurer, M. Shirlaw. Delegates to Yacht Racing Union of the Great Lakes—Edward T. Balcom, George R. Peare and R. B. Brown.

The last Friday and Saturday of July, 1904, were selected as the dates to hold its annual meet. Macatawa Bay was selected as the sailing grounds. The meet will be held under the auspices of the Macatawa Bay Y. C.

One of the features will be the race of 100 miles from Chicago to Holland pierhead, on the way to the meet.

Special Y. R. U. Meeting.

The Yacht Racing Union of the Great Lakes held a special meeting at the Russell House, Detroit, Mich., Saturday, Nov. 21, to consider adoption of classes under 25ft. R. L., but decided to leave all classes below this length alone.

The limit of beam on centerboard yachts was reduced, and the minimum freeboard increased to correspond to that of keel yachts.

The real battle of the small class advocates was fought out in the meeting of the committee appointed to consider the subject, they being unable to agree after wrangling all day and evening of Friday and forenoon Saturday—the principal point being fight of advocates of 20ft. class on Lake Ontario and proposers of 21ft. cabin class, which is strongly advocated on Lakes Michigan and Erie. Neither was willing to have one class adopted to the exclusion of the other, and the Ontario people would not consider the proposition that both be adopted, and, therefore, the union compromised by doing nothing, as it took a two-thirds vote to amend rules, and neither side could muster votes enough to win. It really was a victory for the 21ft. cabin class advocates, as two of the three members of the committee were radical advocates of the 20ft. class.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Commodore Robert E. Tod, senior flag officer of the Atlantic Y. C., will not serve the club in that capacity another year. His successor has not been chosen as yet.

Messrs. Panhard & Levassor, of Paris, France, manufacturers of automobiles and motor boats, will open, on Dec. 1, their American branch at 230-232 West Thirteenth street, New York City. This new office will be in charge of Mr. A. Massenet, and they will devote special attention to the building of high speed motor boats.

Things are very quiet at the Herreshoff shops at Bristol. Only two or three small racing boats are being built. One of them, a 30-footer, is for Mr. Harry Maxwell, who will, no doubt, make an effort to win the Manhasset Bay Challenge Cup with her next season. Another one of the boats is for Mr. C. S. Eaton, who formerly owned Cock Robin. The new boat is a 30ft. waterline cruising knockabout.

George H. Saunders, the boat builder, who was long established in Bristol, and for the past three years in Warren, has sold his shops to the Davis brothers of Providence, sons of the late Ben Davis, who had a yard and shops at Harbor Junction, in Providence. Mr. Saunders is going to Essex, Conn., to carry on boat building in a new plant at that place, and the Davis brothers are moving from Providence to the Warren shops just vacated by Mr. Saunders, where they will set up a railway and machine shop and store boats in the yard for the winter.—Boston Herald.

The members of the New York Y. C. will present to Com. J. Pierpont Morgan, on Christmas Day, a painting of Columbia, which boat enjoys the unique distinction of being the only vessel that has twice defended the America's Cup.

The painting was made by Mr. Carleton Chapman, the well known marine artist.

Shamrock I. is now at Hawkins' yard, City Island, where she will be broken up.

The side wheel steam yacht Charmary, ex-Clermont, owned by Mr. Charles G. Gates, is being overhauled and refitted under the direction of Mr. A. J. McIntosh.

The official summary of the season's racing in the Y. R. A. of Long Island Sound will appear in these columns shortly. The class champions are unofficially reported to be as follows: 43ft. class, sloops, Effort, owned by Mr. F. M. Smith; 36ft. class, Anokat, owned by Mr. W. G. Brokaw; 30ft. class, Alert, owned by Mr. J. W. Alker; 25ft. class, Firefly, owned by Mr. G. P. Granberry; 21ft. class, Jeebi, owned by Mr. A. D. R. Brown; raceabout class, Jolly Tar, owned by Mr. Slocum Howland; Manhasset Bay one-design class, Lambkin, owned by Mr. S. W. Roach; New Rochelle one-design class, Caper, owned by Mr. P. L. Howard. None of the yawls sailed in enough races to qualify, and catboats started so seldom that no record was kept of their performances.

"Graphite Suggestions" is the title of a very handsome and interesting little pamphlet just issued by the Joseph Dixon Crucible Company, of Jersey City. It

tells of the many uses that are made of Dixon's graphite.

At a meeting of the Yacht Racing Association, held at the Arena on Monday evening, Nov. 16, eleven of the twenty-four clubs composing the association were represented by delegates. The meeting was held for the purpose of adopting the restriction outlined by Mr. Clinton H. Crane for four restricted classes, particulars of which appeared in these columns a few weeks ago. The classes were adopted, but there was considerable discussion, and it was late before any decisions were reached.

Some fifty Brooklyn yachtsmen attended the meeting of the Yacht Racing Association of Gravesend Bay that was held at the Assembly, Fulton street, Brooklyn, on Thursday night, Nov. 19. Mr. W. K. Brown presided. The prizes won during the season were presented to the winners, and there was a general discussion of the plans of the association for 1904. Steps are to be taken at once to reorganize the association on the lines of the Y. R. A. of Long Island Sound, so there will be no clashing of racing dates in the future. Open and championship races will also be held. If the new measurement rules proposed by Measurer Henry J. Gielow, of the Atlantic Y. C., are adopted by that club, the association will also adopt them. The Atlantic Y. C., it is understood, will join the association later on.

The next meeting of the association will be called directly after the one in which the Atlantic Y. C. is expected to ratify the new rule.

The Parsons Shipbuilding Company, of Greenwich Piers, N. J., have recently completed a schooner rigged houseboat for Mr. J. Price Wetherill, of Philadelphia. The boat cost in the neighborhood of \$10,000. She will be known as Savanilla, and is 86ft. long and 23ft. breadth.

At the annual meeting of the Erie Y. C., held Nov. 12, the following were elected to serve the coming year: Com., W. L. Morrison; Rear-Com., F. J. Fairbairn; Rear-Com., E. A. Davis; Fleet Captain, C. E. Reichel; Sec. and Treas., W. H. F. Nick; Directors for three years, J. M. Frank, Alfred Gunnison, C. L. Perkins, James Russell, F. M. Slocum; Meas., T. H. Carroll; Asst. Meas., John H. Clemens; Surgeon, D. W. Harper; Asst. Surveyor, John Maahs; Surgeon, Dr. D. V. Reineohl.

The annual meeting, election and dinner of the Manhasset Bay Y. C. will be held at the Hotel Manhattan on Tuesday, Dec. 1. The ticket prepared by the Nominating Committee is as follows, and with the exception of W. Butler Duncan, Jr., as Trustee, means the election of all officers who have served the club during the past year. Com., Alphonse H. Alker; Vice-Com., Charles W. Lee; Rear-Com., H. Winslow White; Sec., Edw. M. MacLellan; Treas., Guy W. Buxton; Meas., Charles D. Mower; Trustees, class of 1906, W. Butler Duncan, Jr., Andrew J. Onderdonk.

Among other amendments to be voted upon at this meeting of the club is the following:

"Ladies may be admitted to the main floor and piazzas of the club house and to the club grounds, one day in the week during the yachting season, when accompanied by a member, or when bearing a visitor's card. The day shall be determined by the Board of Trustees, who may temporarily suspend this privilege whenever they deem it proper to do so, as may also the House Committee, but in case of such suspension, other days shall be named, on which ladies may be admitted, and the number of such days shall in any event, equal the number of weeks that the club house remains formally in commission."

The adoption of such an amendment as the above would indicate that, as elsewhere, the combination of a yacht and country club has not proved wholly a success.

To the man owning a yacht, and who does so for the love of the sport, the club nearest his heart is that at which he can meet and fraternize with other men, whose ideas stand for something in his chosen sport. He does not join a club because of the amount of rum drank there, for true yachtsmen, in spite of the humorist's idea, are not as a class heavy drinkers; nor does he pick the club at which women are allowed full privileges.

It is due to the combined hard work and unstinted generosity of the men who love yachting for yachting's sake that we have to-day on Long Island Sound and along the entire eastern coast, some of the finest club houses devoted to the sport in the world; and in the long run it will be those clubs which cater primarily to yachtsmen, which will prove most successful.

The Manhasset Bay Y. C. at present has probably the largest owning membership of any of the Eastern clubs, and its vote on the amendment submitted will prove of interest to yachtsmen generally.

Canoing

Prizes for Canoeists.

In order to encourage canoeists and small boat sailors who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of *Forest and Stream* offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will

be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. When practicable an outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in. While a chart will count in estimating the events of the log, it is not a necessary factor, and a log may be sent without it.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 21.—Brooklyn, N. Y., Gun Club shoot, 100-target allowance handicap; \$5 to high guns. J. S. Wright, Mgr.
Nov. 26.—Chicago, Ill., Gun Club Thanksgiving Day shoot. A. A. Waters, Sec'y.
Dec. 9-10.—West Baden, Ind.—Grand Opening of Baden-Lick Kennel Club pigeon grounds. John L. Winston, Mgr.

1904.

Jan. 1.—Poughkeepsie, N. Y., Gun Club second annual tournament. A. J. Du Bois, Sec'y.
Jan. 12-15.—Hamilton, Ont., Gun Club tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The annual meeting of the Interstate Association will be held in New York, on Dec. 10.

The next shoot of the Hudson Gun Club, of Jersey City, N. J., is fixed to be held on Nov. 29.

The Aquidneck Gun Club, of Newport, R. I., will be busy at the traps on Thursday of this week, an attractive programme being a theme for consideration of the members.

The Sheephead Bay Gun Club arranged for a number of merchandise events at its Thanksgiving Day shoot this week. The events are open to every one, and all are welcome to participate.

The Union Sportsman's Club, of Bath Beach, N. Y., ended its shooting season at Scarsdale, N. Y., in a match with the Tonawanda Club. The club's next shoot will be at Homewood, N. Y.

The secretary, Mr. A. A. Schoverling, P. O. Box 475, informs us that the Richmond Gun Club, of Concord, S. I., will hold an all-day target shoot on Thanksgiving Day, commencing at 10 o'clock. Turkeys will be the prizes.

The affable secretary of the Brooklyn Gun Club, Mr. John S. Wright, informs us that he will preside over a shoot on his club's grounds, Thursday of this week, commencing at 2 o'clock. Some prizes will be offered to gladden the spirit of the winners.

In the contest for the November cup, at the Crescent Athletic Club shoot, at Bay Ridge, last Saturday three tied on a straight score, namely, Capt. A. W. Money, Mr. A. G. Southworth and Mr. L. W. Palmer, Jr. The low handicap allowances were just enough in each instance to make the needed 25. Mr. J. S. S. Remsen participated after a long absence.

Three five-man teams, representing Princeton, Harvard and the University of Pennsylvania, contested in the annual intercollegiate event at Wellington, Mass., on Nov. 21. Each man shot at 50 targets. Harvard and Princeton tied on 195. In the shoot-off at 10 targets per man, Harvard won with a score of 39 to 35. The University of Pennsylvania's score was 174.

On Dec. 9 Mr. Gus Greiff will give an all-day live-bird shoot on the Guttenberg grounds, New Jersey, commencing at 11 o'clock. The December Handicap at 20 pigeons, open to all, will be the feature of the day. The conditions are \$12.50 entrance, birds included, class shooting, handicaps from 25 to 32yds., \$50 guaranteed. Two sets of traps will be in use.

At the shoot of the Brooklyn Gun Club, Nov. 21, the main event was an allowance handicap at 100 targets, for a gold watch. Several experts participated. Mr. J. S. Fanning, famous as one of America's most skillful shooters, won. Mr. Sim Glover was close up with 98 to Fanning's 99.

At Princeton, N. J., on Nov. 19, the teams of the Princeton Gun Club, and University of Pennsylvania held a trapshooting contest. There were six men to a team, 50 targets per man. Capt. Archer, of the Princeton team, was high man, with a score of 46. Princeton won by a score of 233 to 215.

There were twenty-nine shooters at the tournament of the Ossining Gun Club, Nov. 18. The programme was not finished, owing to insufficient time. The Poughkeepsie nine-man team defeated the Ossining nine-man team for the cup, by a score of 171 to 131. Each man shot at 25 targets. The whirligig of time sometimes lifts the cup.

An interesting live-bird shoot will take place at Earl's, near Elizabeth, N. J., Thanksgiving afternoon, between Mr. Louis Botger, the all-around sportsman and steeple chase rider, and Frederick West Ross, the fifteen-year-old son of Mr. W. E. Ross. The event will be at 25 live birds, \$25 a side, loser to pay for the birds. It has not been learned what handicap young Ross has given Mr. Botger.

Mr. D. P. Hale, who has for the past six years represented the J. Stevens Arms and Tool Co., has resigned, as his manufacturing and banking interests at Sandersville, Ga., required more of his attention than he has heretofore been able to give them. He will be succeeded by Mr. Charles E. Roberts, who has for the past five years been connected with the Winchester Repeating Arms Co., of New Haven, Conn., and the last two years represented them on the road. Mr. Roberts will have entire charge of the territory south of the Ohio River and as far west as Texas.

The programme of the grand opening of the Baden-Lick Kennel Club pigeon grounds, Dec. 9 and 10, states that the competition is for amateurs, and that \$100 will be added. Pigeons, 25 cents. Class shooting, 40, 30, 20 and 10 per cent. On the first day there are three programme events, 10 pigeons, \$7.50; 15 pigeons, \$10; "special, 50 birds, \$50; match for championship of Indiana between the present champion and 'A Has Been.'" On the second day the Baden-Lick Handicap, 25 pigeons, \$25, handicap rise, 26 to 30yds., will be the programme. Targets on the side. John L. Winston, Manager.

The Programme of the Poughkeepsie, N. Y., Gun Club's second annual tournament, to be held Jan. 1, provides eleven events, each at 15 targets, save Nos. 6 and 8, which are at 20 targets; entrance \$1.30 and \$1.75. Events 6 to 11 inclusive have a total of 100 targets, beside the regular events, which will make a 100-target sweepstake, open to all, \$5 extra to enter, and if three or more enter \$5 will be added. For amateur high averages, \$5, \$3 and \$2. For professional high average, \$5. Shooting commences at 11 o'clock. Ship ammunition prepaid to Mr. H. E. Winans, 16 Washington street. Targets 2 cents. Rose system. Sweeps optional. Refreshments on grounds. Shoot rain or shine. Mr. A. J. Du Bois, is the secretary.

BERNARD WATERS.

Cincinnati Gun Club.

THE attendance on Nov. 21 was not quite as large as usual, only sixteen entering in the cash prize event. The weather was pleasant, but a heavy bank of clouds and smoke formed a bad background, and the scores were not what they have been. R. Trimble was high gun, with 45; Medico second, with 43, and Gambell third, with 42. Practice shooting was kept up until about 4:30, when it became so dark that the targets could not be seen, and the members then gathered around the club house stove and swapped yarns.

The club will hold a Thanksgiving Day shoot, to begin at 1:30 P. M. Ten 10-target events, entrance \$1.25 in each, money divided Rose system, 5, 3 and 2. The fourth prize in each event will be a turkey, ties shot off at 10 targets. One cent for each target shot at will be set aside for two high guns, 60 and 40, and three low guns, divided equally. The scores:

Cash prize shoot, 50 targets:			Targets:		
Targets:	15 15 20		Targets:	15 15 20	
R Trimble, 21.....	14 14 17-45		Jay Bee, 16.....	8 10 8-26	
Barker, 19.....	12 10 13-35		Van Ness, 16.....	11 12 17-40	
Williams, 18.....	14 12 12-33		Gambell, 16.....	12 12 18-42	
Sunderbruch, 18.....	10 10 8-28		Faran, 16.....	11 12 16-39	
Medico, 17.....	14 12 17-43		Colonel, 15.....	0 4 4-8	
Hargis, 16.....	11 10 12-33		Jones, 15.....	7 2 10-19	
Roanoke, 16.....	7 11 12-30		Bullerick, 15.....	9 9 14-32	
Captain, 16.....	7 8 12-27		Cottingham, 15.....	3 11 4-18	
Gambell.....18	Medico.....21	Williams.....18			
Faran.....16-34	Van Ness.....18-39	Barker.....21-39			

Gambell's "target saver" is an innovation which means a big reduction in the breakage of missed targets.

Additional scores in the Parker prize gun shoot of Nov. 14:			Targets:		
Targets:	20 20 20 20 20	Broke. Hdp. Total.	Targets:	25 25 25 25	
H Sunderbruch.....	13 11 9 15 16	65 40 100	D I Bradley.....	20 14 20 17-71	G E Greiff.....20 20 22 20-82
Dick.....	17 17 17 17 19	87 32 100	W J Elias.....	3 4 7 10-24	H P Walker.....14 14 16 6-50
Faran.....	16 19 18 17 12	82 18 100	Cahill.....	14 11 13 11-49	F W Perkins.....9 9 10 11-39
Van Ness.....	16 15 16 18 18	83 12 95			
Ahlers.....	18 16 16 16 17	83 10 93			
*Gambell.....	19 20 19 20 20	98 10 160			

*This did not count in the competition. It is a record amateur score for these grounds, and included a straight run of 58.

BONASA.

Intercollegiate Contest.

WELLINGTON, Mass., Nov. 21.—The intercollegiate contest held to-day resulted in a victory for the Harvard team. The opposing teams were from Princeton and the University of Pennsylvania. Harvard and Princeton tied, each scoring 195. In the shoot-off Harvard won by four points. Harvard was unfortunate at the finish on account of Forbes leaving before the contest was known to be a tie. J. Hinckley shot in his place.

The conditions, little or no breeze and good light, which were all favorable. Harvard and Princeton did some good work. P. Bancroft, of Harvard, broke 45 out of 50. The scores:

Princeton			Harvard			U. of P.		
P Archer.....37			T L Marsalis.....32			J Longnecker.....41		
R W Pell.....42			G Forbes.....34			F L Perkins.....28		
A B Gaines.....38			W M Wright.....42			R Koons.....41		
A D Pardoe.....39			F Ingalls.....42			C W Adams.....34		
J Stutesman.....39-195			P Bancroft.....45-195			W G Ferrin.....30-174		
Shoot-off:			Harvard			Princeton		
Bancroft.....	9		Pardee.....	7				
Wright.....	7		Stutesman.....	8				
Ingalls.....	9		Archer.....	8				
Marsalis.....	8		Pell.....	5				
Hinckley.....	6-39		Gaines.....	7-35				

Ashland Gun Club.

LEXINGTON, Ky., Nov. 20.—I append the scores of the last shoot of our newly organized gun club, the Ashland, composed mostly of business men, who are new at the game. It was held Nov. 10.

Fourteen members participated in one of the most delightful shoots of the season. The weather was simply perfect—a bright warm day, with no wind.

There is no fixed programme at these club shoots. A member may shoot as few or as many targets as he wishes, new squads being made up for each round.

There were six events at 15 targets each and one at 10 targets, making a total of 100 targets. Everybody seemed to have their shooting clothes on, and the way some of the beginners smashed targets shows that all they need is more practice.

It may be that the boys had in mind the opening of the game season, Nov. 15, and were making their final preparation before going for Bob White. If they can keep up the gait in the field that they struck at the traps, then many a big bag will be brought in.

Events:			Targets:		
Targets:	1 2 3 4 5 6 7		Targets:	10 15 15 15 15 15 15	
Harp.....	7 9 8 14 12 9 9		Darrow.....	6 11 10 11 11 10 7

IN NEW JERSEY.

Hudson Gun Club.

Jersey City, N. J., Nov. 22.—At the last shoot of the Hudson Gun Club these scores were made.

This club has fully recovered from the effects of the rain-storm last month, and from now on will hold regular shoots. The club suffered quite severely from this storm, the grounds looking like a lake for a week or two after the rain.

Events:	1	2	3	4	5	6	7	8	9
Targets:	25	25	25	25	25	25	25	25	25
Piercy	19	20	19	21

Kelly	13
									</

JAS. HUGHES.

Franklin Gun Club.

Franklin Furnace, N. J., Nov. 21.—Event one, at targets, had contestants and scores as follows: Shooting at 30, John Williams broke 22, Andrew Wright broke 18. Shooting at 25, Will Pape broke 12, Frank Kishpaugh broke 13. Alf Wright broke 6 out of 20.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Nov. 19.—Six men, two of whom—Cheney and Edwards—are beginners at the sport, took part in the regular weekly shoot of this club to-day. The light attendance was due in part to the fact that a number of the boys attended the shoot at Ossining yesterday, and could not consistently leave business to attend to-day's shoot. Their absence is excusable, too. After their performance yesterday at Ossining one would hardly expect to see them all report to-day, and should they choose to celebrate, it would only be natural, for they conquered; their victory, though decisive, was not unexpected; but the odds were a little better than we expected to see. Forty points! A very comfortable margin, indeed. Ossining must have felt like a town swept by a cyclone, and this is only a sample; our best "goods" have not been shown yet.

The ties made on the Traver cup last week were not shot off to-day, owing to absence of Hans. In the race for the Traver cup to-day, Marshall and Claymark tied on 25. Claymark afterward won on the shoot-off:

Events:			Targets:		
Targets:	1 2 3 4		Targets:	10 10 25 25	
Perkins, 4.....	7 22 25		Edwards.....	6 6 11 11	
Claymark, 7.....	6 25 25		*Smith, 5.....	7 6 23 19	
Winans, 7.....	8 8 24		Marshall, 5.....	8 25 24	
Cheney.....	5 5 19 19				

*In this event (shoot-off) Smith shot along, and his score is without handicap added.

SNANIWEH.

New York Athletic Club.

Nov. 21.—Dr. J. G. Knowlton cup, a silver, old-fashioned mug standing about 20in. high, was the main prize. The contest for this trophy is at 100 targets, all scratch. The scores follow:

Targets:			Targets:		
Targets:	25 25 25 25		Targets:	25 25 25 25	
D I Bradley.....	20 14 20 17-71		G E Greiff.....	20 20 22 20-82	
W J Elias.....	3 4 7 10-24		H P Walker.....	14 14 16 6-50	
Cahill.....	14 11 13 11-49		F W Perkins.....	9 9 10 11-39	

Ten pairs: Bradley 10, Elias 3, Cahill 10, Greiff 10.

Fifteen targets: Bradley 8, Cahill 8, Greiff 5, Elias 5.

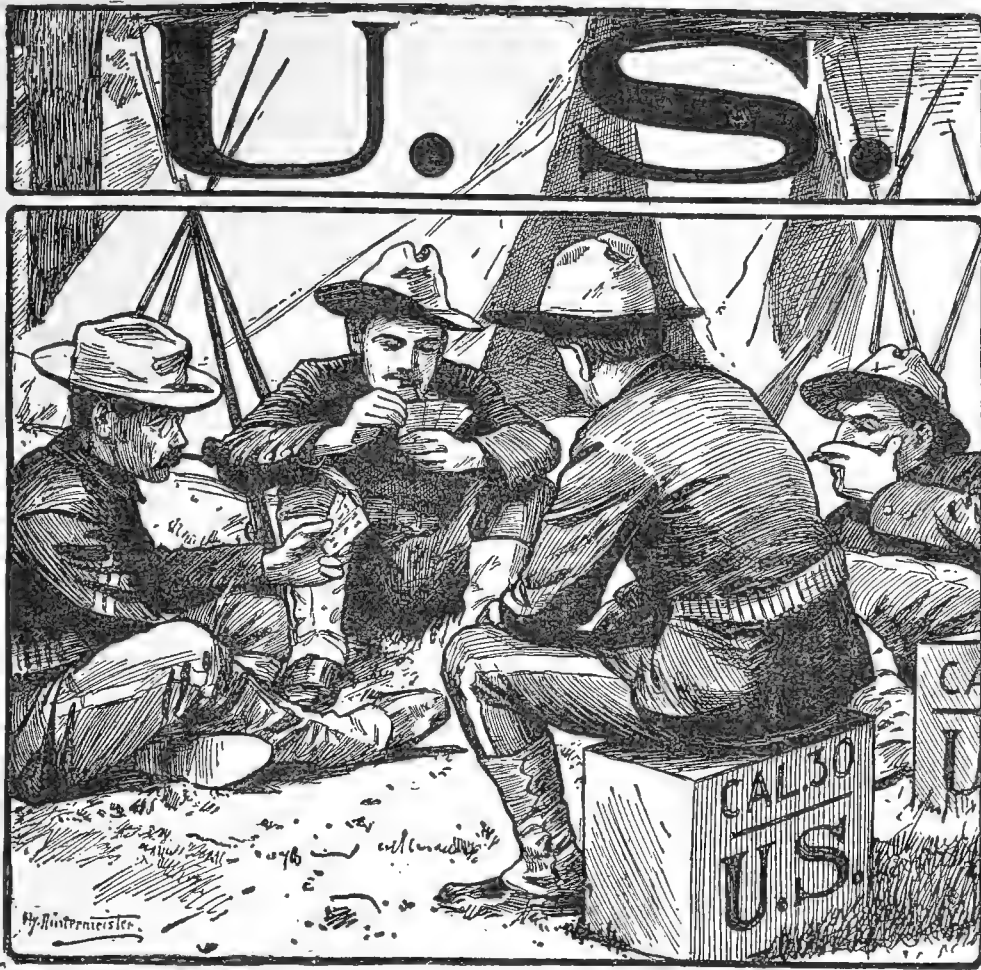

The next shoot will be on Thanksgiving Day, when the holiday cup will be shot for. This cup must be won three times to become the property of the winner.

On Nov. 28 will be the first shoot for the Dan Bradley cup, which will become the property of him who wins it two times.

Aquidneck Gun Club.

NEWPORT, R. I., Nov. 21.—The weekly shoot of the club, being the tenth contest for the L. C. Smith badge, donated by the Hunter Arms Co., was held on Wednesday, with the small attendance of six. The weather conditions were not especially good. The day was dark, and keen eyesight was a goodly advantage. However, some good totals were recorded. Mason bettered his score of last week by one target. Coggeshall was also in evidence with three less. An improved attendance is hoped for at the Thanksgiving Day shoot, when an attractive programme will be run off. The scores:

Targets:			Targets:		
Targets:	10 10 10 10		Targets:	10 10 10 10	
Mason.....	10 9 8 7 8-42		Bowler.....	7 7 8 6 5-32	
Coggeshall.....	6 8 7 8 10-39		Ding.....	7 6 5 7 7-32	
Powel.....	9 7 7 6 9-38		Macomber.....	4 6 3 2 8-23	

U.S. AMMUNITION

FOR

SERVICE OR SPORT.

UNITED STATES CARTRIDGE CO.

LOWELL, MASS.

Agencies: 497-503 Pearl Street, 35-43 Park Street, New York.
114-116 Market Street, San Francisco.

Salina Tournament.

SALINA, Kans.—The dates of the Salina tournament were Nov. 17-19.—What should have been one of the best, if not the best, tournament held in Kansas this year was, owing to stormy weather, limited as to attendance. Added money, \$200, should be a drawing card, and Salina is so centrally located as to draw shooters from any part of the State; but the summer weather of last Sunday forenoon was so suddenly changed, increasing to wintry until Tuesday morning that it caused many to remain at home.

The jumping targets and the cold wind caused many who came first day to return home on the close of that day. The second day was an improvement, and some good scores were made. The wind changed from north to west, and was not so strong. The trap did not work the best from the want of the proper attention, and that delayed matters, which made those with cold fingers feel uncomfortable.

Mr. H. Anderson, the general manager and all-round hustler, was untiring in his efforts to make everything go off pleasantly, but with his shooting in every event, he was very much overworked. He was very ably assisted by Mr. Woodhouse and Mr. Brown, who attended to office duties and the scoring.

The attendance numbered the following traveling men: Chas. Spencer, of St. Louis; Wm. Heer, of Concordia. Then came George Mackie, of Scamman, Kans.; Dave Elliott, Kansas City; E. W. Arnold, Larned, Kans.; W. Clayton, Kansas City; Chas. Debus, and Geo. Lewis, of Herrington, Kans.; F. C. Cairns, Banner City; H. E. Wetzig, Concordia; F. E. Ruggles, Jewell City; E. Wetzig, Junction City; A. C. Williams, Wichita, Kans.; C. Banham, Junction City; W. R. Hossler, Enterprise; Mr. Logan and H. Hugg, of Larned, and Ed O'Brien, of Florence, Kans.

W. H. Heer was high man on the first day, with 185 out of 200, and he was shooting a new gun for the first time. Spencer was second, with 180, and Arnold was high amateur with 179.

More than the usual amount of money was won by those who now and then made straight scores.

The cashier paid out amounts of \$63, \$43, \$30, \$27 and others above the entrance. These gentlemen were much pleased with the \$100 added money.

First Day, Nov. 17.

Second Day, Nov. 18.

The weather was much improved, and Arnold made a wonderful showing, losing but six for the day, beating Heer by four targets. He made a run of over 100 straight, losing but two out of the last 120.

Heer lost but ten, and five of these were in two events, where he made 17 and 18 out of 20. Thus he won high average on the good score of 375 out of 400.

The surprise of the meeting was the great score made by Arnold, 373, only two behind Heer. He has shot but little this year, being busy on his farm out in the short grass country.

Third Day, Nov. 19

The weather was not of the best; forenoon clear, afternoon cloudy, with a strong southwest wind that made many of the birds very swift left-quarterers, and hard to stop.

Anderson, being an experienced live-bird shot, was given 27yds., and easily won the 25-bird event. Ed O'Brien won the 15, and Anderson the third on a shoot-off.

The live-bird shooters were scarce, as most of the target shooters went home during the night. Mr. Anderson had 700 birds left on his hands, as many who had promised to come, failed to show up.

Twenty-five live birds, \$15 entrance, handicap:

Anderson, 27yds.1221022221221122212221202—23
Heer, 321223022221122210022212022—21
Tipton, 291222222022121111200222021—21
Clayton, 3012222202022221222200112022—20
O'Brien, 302222220222222102220012020—20
Spencer, 322*22222220222220022222002—19
D. Elliott, 312222102220120022002002021—19

Fifteen live birds, \$10 entrance, three moneys: O'Brien (30) 14, Clayton (31) 13, Tipton (29) 13, Anderson (29) 11, Spencer (31) 11, Heer (31) withdrew.

Ten live birds, \$5 entrance, three moneys: Clayton 9, Tipton 9, Anderson 9, Smut 9, Reminette 8, Hoynes 6, O'Brien 9.

Ossining Gun Club.

OSSINING, N. Y.—The Wednesday (Nov. 18) shoot of the Ossining Gun Club was everything that could be desired—good weather, good attendance of good shooters, who, however were handicapped by fast targets, helped by a rather strong wind, which made them cut up scandalous.

W. Perkins, of Poughkeepsie, won the after-dinner coffee set, valued at \$31, with a score of 75 out of 80, which included his handicap of misses as breaks.

Messrs. Ed Banks, C. Wilhite and Sim Glover, tied for second with a net score of 73 out of 80.

For the greatest actual number of breaks in the event, Messrs. Banks and Glover divided the \$10.

Owing to the number of entries it was necessary to cut the prize event down to 80 targets. Even then the last 20 were shot in semi-darkness. This was unfortunate, though luckily the scores were not close enough to cause any trouble by dropping fractions.

The Poughkeepsie cup was taken back by the team of the Poughkeepsie Gun Club, with the wide margin of 40 targets. The home team was very weak, owing to the absence of some of the strongest men in the club. We were glad to have with us Charlie Wilhite, secretary of the Manila (P. I.) Gun Club, who came up with Mr. Banks. He is a fine sportsman, and his company was enjoyed by all. Team scores:

Poughkeepsie—I. Tallman 21, W. E. Perkins 22, H. W. Bissing 21, A. Travis 18, A. J. Du Bois 17, F. B. Stephenson 21, R. Gorman 16, W. E. Adriance 17, F. I. Tompkins 18; total 171.

Ossining—G. B. Hubbell 17, C. G. Blandford 21, A. Betti 17, A. Harris 10, I. T. Washburn 13, W. Fisher 14, A. Bedell 18, J. Hyland 13, W. S. Smith 8; total 131.

Figures after the names denote misses as breaks as allowed in 100-target match for trophy. As only 80 birds were shot at in the prize match (events 4, 5, 6, 7), the contestants were allowed four-fifths of this number:

Shoot off: Southworth 15, Hagedorn 8.

Trophy match, 15 targets, handicap:

Brigham	0	15	Palmer	1	13
Wigham	3	15	Money	1	11
Hagedorn	2	14	Werleman	5	10
Southworth	3	13			

Shoot-off: Brigham 13, Wigham 12.

Cumberland Gun Club.

DAVENPORT, Ia., Nov. 12.—The Cumberland Gun Club's three-day open handicap tournament ended to-day. The attendance was not large, but those who were present had a good time, and kept busy trying to make good scores, both at targets and live birds. The shooting was very hard. A high wind was in evidence each day, and the straight scores were quite few. Fifty dollars was given to the three high guns.

In the target programme Gilbert won first, Budd second, and Spencer third. Henry Arp was high in the amateur class, and did some fine shooting at both targets and live birds.

Owing to a light entry on live birds for the 25-bird event, the programme was changed, and two 10 and two 15 bird events were shot. The birds were a fine lot. The shooting was very interesting. Quite a number of spectators were on the grounds each day and took quite an interest in the sport.

Mr. S. A. Tucker was present, but did no shooting.

The trade representatives were Messrs. Budd, Hughes, Adams, Gilbert, Spencer, Lord and Whitney.

This tournament will about close the shooting in Iowa for 1903, as the game birds will claim the attendance of the sportsmen during the rest of the year.

First Day, Nov. 10.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Total.

Third Day, Nov. 12.

Fifty-target handicap, counted in average on targets, \$5 entrance, four moneys: Arp (18) 36, Budd (21) 41, Gilbert (22) 44, Spencer (21) 43, Lord (19) 40, Sieben (17) 42, Burmister (17) 40, McBride (17), 39.

Ten birds, \$5 entrance, four moneys, handicap: Arp (29) 8, Budd (31) 9, Spencer (31) 9, Gilbert (32) 9, Samuelson (29) 10, Litzke (28) 4, Hughes (31) 6, Warner (27) 7, Burmister (28) 6, Sieben (29) 10, Rogers (27) 6, Decker (28) 8, Causmaker (28) 5, Rumler (28) 8, Stone (29) 7.

Fifteen birds, \$10 entrance, four moneys: Arp (29) 15, Budd (31) 15, Gilbert (32) 13, Spencer (31) 15, Hughes (31) 13, Sieben (29) 10, Stone (29) 11, Sperry (30) 12, Warner (27) 9, Rogers (27) 12, Decker (28) 12, Rumler (28) 10, Burmister (28) 11.

Fifteen birds, \$10 entrance, four moneys: Arp (29) 15, Budd (31) 14, Gilbert (32) 14, Spencer (31) 14, Hughes (31) 11, Nicola (27) 6, Stone (29) 9, Rogers (27) 12, Sperry (30) 13, Warner (27) 11, Burmister (28) 13, Decker (28) 11, Sieben (29) 10.

Ten birds, \$5 entrance, four moneys: Arp (29) 8, Budd (31) 8, Gilbert (32) 9, Spencer (31) 10, Stone (29) 5, Nichols (27) 4, Warner (27) 3, Rogers (27) 8, Decker (28) 4, Burmister (28) 7, Kittelsen (27) 5, Hughes (31) 9.

Old Fashion Shooting Matches.

DEERY, N. H.—*Editor Forest and Stream*: I recently read a communication in the *FOREST AND STREAM* on an old-time shooting match, which reminded me of some of the match shoots they used to have when I was a boy on the southern coast of Massachusetts, at Westport Point. This was 'way back in the early 70s.

This little village of 100 people was composed of old, retired sea captains and fishermen, most of whom owned an old single-barrel smooth bore, or Queen's arm. The principal merit of the gun was "how well it would shoot a ball," so every Thanksgiving Day they would hold a shooting match with these old guns, at ball shooting. The distance was 40 rods (220yds.). The range would be from the road to the river. A big mud flat was the background. Their target was a plucked goose, with its wings and neck folded and tied close to the body. This was suspended on a cross rail from an old tree stump. The fee was 10 cents a shot. The bird was examined after each shot to see if it had been hit. All guns must be smooth bores, loaded with a single ball. Guns to be shot offhand.

I remember one man had an old Kentucky rifle that he had

had rebored to a smooth bore, and after some 15 minutes' examination and argument whether to bar this gun, he was allowed to shoot. Then the next thing he sprung on them was taking the ramrod out and sticking one end of it into his left trousers' pocket. Grasping it near the end, it formed a V to rest the barrel of this ex-rifle in. This put up another howl. Well, they finally allowed him to shoot some of his little bullets. He shot, I think, all of the morning, and only got one bird.

They used to shoot those old guns with an ounce ball well enough. The promoter would lose a dozen birds, and perhaps take in \$20 for his poultry, which was well sold.

They also used to have sometimes two of these guns to a house, one loaded with a ball, the other with BB. for wild geese. Sometimes they would have a few bullets with a hole punched through them, so as to "make them whistle" when shooting at long range, to raise a flock of ducks that was on the water.

I was down there not long since, and I find the old fellows and the old guns have gone where the buffalo and Indians have gone. Their sons are equipped with modern breechloaders, and the goose shooting match is a thing of the past.

JOHN W. BABBITT.

Interstate Grand American Handicap at Targets.

THE following is an official communication on the subject of which it treats:

The Grand American Handicap at live birds up until the year 1902, may be said to have attracted the attention of all trapshooters of the United States, to that one great event, which occurred in the spring of the year. The Grand American Handicap at targets having now taken the place of the Grand American Handicap at live birds, and having become the premier trapshooting contest of each recurring season, naturally attracts an almost equal amount of consideration and competition on the part of clubs and other organizations, who desire to have that event carried out on its grounds.

A few years ago it was necessary, for certain important reasons, to decide during the fall of the year as to where the Grand American Handicap at live birds of the succeeding season should be held. Latterly, no arrangements of any kind and no programme for the ensuing season have been suggested or made by the Interstate Association prior to its annual meeting, which is held on the second Thursday of each December.

It would seem, from editorial comment that has appeared in certain of the sportsmen's journals recently, as if the Interstate Association and its several officials had already decided a plan of campaign for 1904. Such, however, is not the case, and Manager Shaner denies most positively that he has voiced any sentiments as to what the plans for 1904 should be, or as to where the Grand American Handicap at Targets next season should be held. President Irby Bennett and other prominent officials of the Interstate Association, likewise agree in denying that they have either individually or collectively expressed any opinions as to where it may be best to hold the Grand American Handicap at targets in 1904. Everything will be settled at the annual meeting on Dec. 10, next. Until, therefore, the report of that meeting is published, comment of any kind can only be classed as mere guesses.

SIDE LIGHTS OF TRADE.

Messrs. Von Lengerke & Detmold, 318 Broadway, New York, report that the demand for their Francotte and Knockabout guns is nearly double what it was last season, and also that there is a great demand for their hand-loaded shells.

The J. Stevens Arms and Tool Co., of Chicopee Falls, Mass., have sold their machinists' tools, patents, good will, etc., pertaining to the same, to the L. S. Starrett Co. The firearms branch of the company had reached such a magnitude that the alternatives were to curtail the product, erect more buildings or dispose of some department. The transfer took place on Nov. 20. The additional space thus gained will be applied to the manufacture of firearms.

At Hamilton, O., Nov. 5, and 6, Mr. Hood Waters won high general average, breaking 318 out of a possible 350, using "Infallible."

Oct. 22, Mr. F. B. Ellett, Keithsburg, Ill., broke 75 clay birds straight from the 18yd. mark. He shot U. M. C. factory loaded Arrow shells.

Rifle Range and Gallery.

Zettler Rifle Club.

THE fifth weekly shoot of the Zettler Club in its winter gallery contest was held at the club's headquarters, on Tuesday, Nov. 17. Eleven members were present. Among them was Louis C. Buss, who was elected a member the week previous. Buss led the group with an average of 244 for 10 shots. The scores are appended, 10-shot scores, 25-ring target, distance 75ft.:

L C Buss	239	246	245	244	245	1219
R Gute	243	244	245	245	244	1221
H Fenwirth	243	243	242	243	240	1211
	245	244	248	237	245	1219
A Krousberg	229	240	235	235	240	1179
C G Zettler, Jr.	224	226	236	230	239	1155
W A Hicks	245	240	246	244	246	1221

H C Zettler	237	232	236	242	237	1184
B Zettler	235	236	235	236	233	1175
T H Keller, Jr.	232	237	233	233	237	1162
T H Keller, Sr.	227	220	240	214	228	1129

Miller Rifle and Revolver Club.

THE members of the Miller Rifle and Revolver Club, of Hoboken, N. J., show an increased interest in their gallery practice this season. This is accounted for in a measure by the fact that the Bundesfest is to be held in Union Hill Park next year (June 12-20).

The Miller club, at the present time seems to be about the only rifle club in Hudson county that is developing much activity in shooting. There are a number of rifle clubs located between Guttenberg and Bergen Point, but nearly all of them are in a condition of innocuous desuetude. The scores for last week's shoot, Nov. 18, are appended, 10 shots, 25-ring target, distance 75ft.: C. Bischoff 244, F. Unbehauen 240, J. Bischoff 239, R. A. Goldthwaite 237, R. W. Evans 234, C. Bayha 231, W. Grobe 227, D. Dingman 243, D. Miller 239, C. Miller 239, A. Meyns 234, R. A. Blake 231, P. Schultz 231, C. Kinsey 222.

New York Central Corps.

THE New York Central Corps opened its winter gallery prize shooting for the season 1903-04 at Zettler's, on Nov. 18. Over twenty members were present to take part in the contest. The programme calls for two shoots per month, and two 10-shot scores on the 25-ring target, at each meeting, and one shot on the bullseye, 4in. carton, for the best center shot. J. N. Sieb was first on the ring target, with two scores of 238; H. D. Muller was second. On the bullseye target, H. D. Muller was first, with a good bullseye, measuring 34 degrees. Scores:

Ten-shot scores, two scores to count, 25-ring target, distance 75ft.: J. N. Siebs, 238, 238; H. D. Muller, 236, 233; D. Scharninghaus, 232, 234; F. Brodt, 222, 234; W. J. Daniels, 221, 227; B. Eusner, 223, 224; J. Feldscher, 223, 223; C. Gerken, 215, 228; F. Jaegers, 231, 210; J. Von der Lieth, 219, 221; F. Schiller, 214, 225; F. Roffmann 211, 227; H. Schrader, 213, 224; A. Ritterhoff, 218, 216; F. Bauman, 206, 213; C. Tietgen, 204, 203; F. Engelking, 203, 203; J. Kock, 192, 203; H. Von der Lieth, 206, 180; H. Eckoff, 189, 186; C. Pletz, 184, 185; A. Ihlenberg, 185, 182.

Bullseye target, best center shot: H. D. Muller 34 degrees, C. Gerken 55, F. Schiller 74, J. Kock 76, J. N. Siebs 85, D. Scharninghaus 87½, F. Jaegers 100, F. Roffmann 114, H. Von der Lieth 119, C. Tietgen 121, A. Ihlenberg 125, J. Von der Lieth 145, J. Feldscher 145, F. Brodt 156, C. Pletz 164, H. Schraders 173, F. Engelking 195.

New York Turner Cadet Corps.

THE boys of the New York Turner Cadet Corps held a prize shoot at Zettler's, Nov. 20. Forty-one members were present and took part in the contest. The conditions called for 3 shots each on the 25-ring target. Scores: M. Stoneham 72, E. Heidelberg 72, F. Raichlen 72, L. Petersen 71, J. Henschlager 70, K. Zenker 70, G. Pfister 69, M. Lindemann 69, K. Moesinger 69, K. Eckenwalter 68, A. Cohn 67, Geo. Solter 67, F. Stotl 65, E. Heinsohn 65, A. Ducai 65, J. Kissel 64, Geo. Rohrs 63, F. Esslinger 63, Geo. Utte 62, A. Eckenwalter 62, S. Openheimer 62, H. Egge 61, W. Fleischmann 61, Felix Larsen 59, F. Schalk 59, L. Porr 58, F. Walsch 56, A. Ahrenholz 54, W. Geisler 50, Wm. Pressler 49, L. Fleischmann 47, K. Pressler 43, I. Kaufmann 40, M. Kramer 38, L. Zeigler 32, M. Aufses 22, G. Muller 21, E. J. Aronson 12.

Greenville Shooting Park.

THERE was quite a number of the regular patrons of this park on the range on Nov. 21. Among them were Dr. Hudson, Wm. Hayes, L. P. Hansen, Louis Maurer, Aug. Begerow and Major E. Taylor.

Dr. Hudson, who made the phenomenal score on this range on Nov. 5, still holds his form. The Doctor only had an opportunity to shoot three scores on Saturday. Scores:

Dr. W. G. Hudson, 227, 237, 233; A. Begerow, 206, 215, 208; L. P. Hansen, 223, 218, 203, 217, 221; L. Maurer, 219, 224.

Only two of the revolver shooters of the Manhattan Rifle and Revolver Club were on the range. Messrs. J. A. Dietz and J. E. Silliman. Scores:

Revolver, 50yds.: J. A. Dietz, Jr., 89, 88, 92, 89; J. E. Silliman, 86, 86, 87.

Lady Zettler Rifle Club.

THE members of the Lady Zettler Rifle Club, under the leadership of its president, Mrs. H. Fenwirth, held the first shoot of the present season in the Zettler ranges, Nov. 21. Fourteen members took part in the contest.

The Zettler Club presented the Lady Club with a special prize, which was won by Miss Millie Zimmermann. Conditions, 10 shots, 25-ring target, distance 75ft., muzzle rest. Scores: Miss Millie Zimmermann 492, Miss Muller 485, Mrs. L. Turbeit 483, Miss Kate Zimmermann 482, Miss Kate Laut 481, Mrs. H. Fenwirth 479, Mrs. F. Watson 473, Miss A. Koch 470, Mrs. Geo. Bernius 456, Mrs. H. Scheu 451, Mrs. B. Zettler 443, Miss E. Hart 448, Miss B. Eusner 404, Mrs.

CONCERNING WOMAN'S WORRY.

"AND while you are writing about worry," she suggested, "you might add that it is not confined to one sex. Men worry as well as women."

Which we are bound to concede, and would make due account of were we writing of the worry of the universe. Men do worry; and sometimes they appear to believe that if they did not worry and worry hard, everything would be at sixes-and-sevens, and the world would come to an end. But a subject so vast were wisely shunned.

We have to do with woman's worry; in particular with that phase of anxiety in which so many dear women indulge themselves when their husbands or sons go off on those absurd trips for fish and game. It is something which deserves recognition in *FOREST AND STREAM*. For over thirty years there have been chronicled in these columns the experiences of the man of the rod and gun, his expeditions into far distant parts, his adventures, perils and hairbreadth 'scapes. But in all these years no account has been made, or if any it has been but meagre and scanty, of that feminine solicitude, which, whether we are conscious of it or no, is a very real and constant and unfailing element in our absences on our pleasure outings. It has attended us indeed through all our lives, having had its beginning as maternal anxiety at a time certainly not later than those summer days when with other boys of other anxious mothers we repaired to the old swimming hole, and reaching full development on the occasion of our first gun. Parenthetically be it noted, the making of many a good sportsman has been thwarted because of a mother's failure to endure with Spartan fortitude her boy's ordeal with his first gun; and many a man is to-day for no other reason than this deprived of the resource of enjoyment in the field. Further in parentheses be it said, the second boy gunner in a family gives less concern than did his elder brother.

There is no disguising the fact that the conditions of a sportsman's life are in a peculiar degree favorable to the promotion of worry on the part of the folks at home. In the first place, the notion of peril is inseparably associated with the use of firearms. Then the hunter goes into the wilderness, into places of danger, perhaps far remote and beyond reach of aid in case of accident. Under these circumstances it is quite natural that solicitous fancy should conjure up all sorts of catastrophes, from that of drowning from a canoe to being shot by mistake for game. Every report in the newspapers of a man killed for a moose stirs up anew dire apprehension and fills the soul with forebodings of evil.

The capacity of worry, being largely individual, is in some cases so highly developed that the misery it causes is exceedingly great, even where there is no actual ground for the anxieties that produce it. Some sportsmen's wives make themselves so wretched by reason of their worry that one is tempted to speculate whether if the happiness and the unhappiness thus involved in an outing could be balanced one against the other, the wretchedness of the stay-at-home would not outweigh the wanderer's pleasure. Of such an extreme type an example is recorded in Mary Kingsley's biography of her father:

"I confess," she writes, "in old days I used to contemplate with a feeling of irritation the way in which my father used to reconcile and explain it to himself, that because he had a wife and family it was his dire and awful duty to go and hunt grizzly bears in a Red-Indian-infested district, and the like. I fancy now that I was wrong to have felt any irritation with him. It is undoubtedly true that he could have made more money had he settled down to an English practice as a physician; also undoubtedly true that he thoroughly enjoyed grizzly bear hunting and 'loved the bright eyes of danger'; still, there was in him enough of the natural man to give him the instinctive feeling that the duty of a father of a family was to go out hunting and fighting while his wife kept the home.

"But I am fully convinced his taking this view of life really caused the illness which killed my mother. For months at a time she was kept in an unbroken strain of nervous anxiety about him. There were months when no letter came; then when one came it was merely retrospectively reassuring for the period behind its rather vague date, and usually indicated that he was forthwith going on somewhere else, where his chance of getting

killed was as good as ever. When he was in the South Seas she had a most anxious time of it. There would come a letter eloquently setting forth the dangers of coral reefs and cannibals; then silence; then a paragraph in some newspaper to the effect that a schooner, name unknown, had been wrecked on some South Sea reef or another (in the region where she knew he might be), and that the crew had been massacred and eaten by the natives. Of course having him in North America was no more restful for her. Letters from him were necessarily scarce, and newspaper paragraphs not a bit more reassuring in tone, for they took the form of statements that the Sioux or some other redskin tribe were on the war-path. Indeed, the worst shock she ever had was when he was away in North America. The last letter she had had from him informed her that Lord Dunraven and himself were going to join General Custer on an expedition, when there came news of the complete massacre of General Custer and his force. A fearful period of anxiety followed, and then came a letter saying that providentially they had been prevented by bad weather from joining General Custer at all. These anxieties, although groundless, were not good for so high-strung and sensitive a woman as my mother. No amount of experience in her husband's habit of surviving ever made her feel he was safe, and her mind was kept in one long nervous strain which robbed her of all pleasure in life outside the sphere of her home duty and the companionship of books."

And all this misery was unjustified of the end. Her husband was not devoured by South Sea cannibals, nor scalped by red Indian Sioux. He died at the last in his own bed at home, "having passed away quietly in his sleep."

That which may be said of worry in general is to be said also of this particular phase of woman's worry for her absent sportsman, that as a rule the evils concerning which one worries exist for the most part only in the perturbed imagination. It is, indeed, not an unusual trait of the feminine nature to indulge itself in melancholy daydreams of affliction, to picture in sweetly sad reveries the grief which would come with overwhelming force if such and such things should happen, and such and such relatives or friends should meet disaster or death. To assume that this is exclusively a feminine failing would, of course, be incorrect, but the truth perhaps is that woman is the more given to such self indulgence in fancied sorrow.

The phenomenon is one which has been recognized from ancient times and has place in folk-lore stories, of which the variants are widely disseminated, showing thus the popular opinion of the foolishness and futility of borrowed trouble. Among the versions collected by Clouston, "a young husband had provided his house with a cradle in natural anticipation that such an interesting piece of furniture would be required in due time. In this he was disappointed, but the cradle stood in the kitchen all the same. One day he chanced to throw something into the empty cradle, upon which his wife, his mother, and his wife's mother set up loud lamentations, exclaiming: 'Oh, if he had been there, he had been killed!'" alluding to a potential son. In one of Grimm's Household Tales, Clever Elsie was sent to the cellar to draw beer, and seeing a pickax hanging on the wall exactly above her began to weep, and said: "If I get Hans, and we have a child, and he grows big, and we send him into the cellar here to draw beer, then the pickax will fall on his head and kill him." As she was weeping over this misfortune that lay before her, the maid came down to see what the matter was, and learning the cause wept with her; and then came the mother and the brother, and at last the father, who all sat together crying because of Elsie's child—that Elsie might perhaps bring one into the world some day, and that he might be killed by the pickax, if he should happen to be sitting beneath it drawing beer just at the very time when it fell down.

In the Venetian story, as in numerous others, is given the same incident of the bride weeping in the cellar:

"They were married, and when they were in the midst of their dinner, the wine gave out. The husband said, 'There is no more wine!' The bride, to show that she was a good housekeeper, said: 'I will go and get some.' She took the bottles and went to the cellar, turned the creak, and began to think: 'Suppose I should have a son,

and we should call him Bastianello, and he should die! Oh, how grieved I should be! Oh, how grieved I should be!' And thereupon she began to weep and weep; and meanwhile the wine was running all over the cellar.

"When they saw that the bride did not return, the mother said: 'I will go and see what the matter is.' So she went into the cellar, and saw the bride, with the bottle in her hand, and weeping. 'What is the matter with you that you are weeping?' 'Ah, my mother, I was thinking that if I had a son, and should name him Bastianello, and he should die, Oh, how I should grieve! Oh, how I should grieve!' The mother, too, began to weep, and weep; and meanwhile the wine was running over the cellar.

"When the people at the table saw that no one brought the wine, the groom's father said, 'I will go and see what is the matter. Certainly something wrong has happened to the bride.' He went and saw the whole cellar full of wine, and the mother and bride weeping. 'What is the matter?' he said; 'has anything wrong happened to you?' 'No,' said the bride; 'but I was thinking that if I had a son, and should call him Bastianello, and he should die, Oh, how I should grieve! Oh, how I should grieve!' Then, he, too, began to weep, and all three wept; and meanwhile the wine was running over the cellar.

"When the groom saw that neither the bride, nor the mother, nor the father, came back, he said: 'Now I will go and see what the matter is that no one returns.' He went into the cellar and saw all the wine running over the cellar. He hastened and stopped the cask, and then asked: 'What is the matter that you are all weeping, and have let the wine run all over the cellar?' Then the bride said: 'I was thinking that if I had a son and called him Bastianello, and he should die, Oh, how I should grieve! Oh, how I should grieve!' Then the groom said: 'You stupid fools! Are you weeping at this and letting all the wine run into the cellar? Have you nothing else to think of? It shall never be said that I remained with you. I will roam about the world, and until I find three fools greater than you, I will not return home.'"

But let it not be thought that the citation of such old world tales is with intent to ridicule or make light of that woman's worry to which in the beginning we declared we were to pay the tribute of our recognition. Count woman's worry a foible if we will, yet is it one for which we hold her more dear. The mother's anxiety which watched our comings and goings in the days of youthful sportsmanship has long since taken its place with the memories which grow more tender as the years go by. If it made slight impress on us then, there is no man of us all but is the better for the thought of it now. And as for the undue solicitude of those whose hearts now go with us, go we never so far in our wilderness wanderings, this surely we may regard with indulgence.

THE STATE DINING ROOM.

WHEN the White House alterations were made this year so largely under the direction of President Roosevelt, it was to be expected that in the adoption of a new scheme of decoration for the State Dining Room, fitting place would be found for the representation of America's big game animals. The room is finished in dark oak throughout, and the deep rich colors of the wood give an admirable background for the trophies. The heads have been carefully chosen and are typical specimens. Our illustrations show above the mantel of the west wall a moose head, and on either side a head of the mountain sheep. In the center of the east wall is the large Alaskan moose head which was presented to President Roosevelt by residents of the Territory. On either side is a bear's head; and on the same wall are a buffalo head and the caribou head which was presented by Senator Quay. In the center of the north wall is an elk head, and on the sides are deer. The south wall bears one head of a mountain sheep and one of deer. When one looks upon the new State Dining Room thus adorned, his reflection is that no more appropriate scheme of decoration could have been chosen than this, which speaks so adequately of the great game resources which in pioneer days have contributed so much toward making possible the development of the continent.

Mashpee.

SOUTH SANDWICH, Massachusetts.—*Editor Forest and Stream:* A new edition of the correspondence of Daniel Webster will soon be published in Boston. Through the kindness of the editor and publishers, I am permitted to send to FOREST AND STREAM two letters hitherto unpublished, which I think will be interesting to your readers.

The first one, which was written shortly before Mr. Webster's death, was sent to Benj. C. Clark, Esq., recently president of our Massachusetts Fish and Game Protective Association, and may explain in part why Mr. Clark has continued to this day to be an enthusiast on the subject of tautog fishing, as well as a sturdy all-round sportsman.

To B. C. Clark, Jr.

MR. PAIGE'S, NAHANT, Friday Morning, July 23rd, 1852.

MY YOUNG FRIEND,—I propose joining you this morning, to pay our respects to the Tautog, but fear we shall hardly be able to tempt them from their lurking-holes, under this bright sun. They are naturally shy of light. "Tautog" means simply the "black fishes," "og" being a common termination of plural nouns in the language of our Eastern Indians. I believe the fish is not known in Europe. Its principal *habitat* originally seems to have been Long Island Sound, Buzzard's Bay, and the Elizabeth Islands. Seventy years ago the Hon'ble Stephen Gorham, father of the Hon'ble Benjamin Gorham, now of Boston, brought some of these fish alive from New Bedford and put them into the sea at Boston. They are now found as far East as the mouth of the Merrimac. They abound, as you know, on the south side, as well as on the north side of our Bay. Indeed, it is thought that by their own progress north they doubled Cape Cod, not long after Mr. Gorham's deposit, at Boston.

Thirty years ago, Mrs. Perkins, the wife of the late Samuel G. Perkins, a lady whose health led her to pass her summers on the sea-coast, and who had a true love for fishing, caught a Tautog, with a hand-line, off these rocks, which weighed 20 lbs.

It will suit me quite as well to go off again, in the beautiful "Raven," if we can obtain plenty of bait, and especially if your Father will accompany us.

Yours truly,

DAN'L WEBSTER.

Although Mr. Clark has recently celebrated the fiftieth anniversary of his graduation from Harvard, he is still alert and vigorous, and only last week told me that this season he had taken the largest tautog of his life.

The second letter was written from this town to Henry Cabot, grandfather of our present U. S. Senator, Hon. Henry Cabot Lodge; the year is not mentioned in the date, but Senator Lodge thinks it was written between 1830 and 1840.

To Henry Cabot.

SANDWICH, June 4,

Saturday Morn'g, 6 o'clock.

DEAR SIR,—I send you eight or nine trout, which I took yesterday, in that chief of all brooks, Mashpee. I made a long day of it, & with good success, for me. John was with me, full of good advice, but did not fish, nor carry a rod.

I took 26 trout, all weighing 17 lb. 12 [oz]

The largest (you have him) weighed at
Crocker's 2'—4 oz
The five largest 8—5 oz
the eight largest 11—8 oz

I got them by following your advice; that is, by *careful & thorough* fishing of the difficult places which others do not so fish. The brook is fished, nearly every day. I entered it, not so high up as we sometimes do, between 7 & 8 o'clock, & at 12 was hardly more than half way down to the meeting house path. You see I did not hurry. The day did not hold out to fish the whole brook properly. The largest trout I took at 3 P. M. (you see I am precise) below the meeting house, under a bush, on the right bank, two or three rods below the large *beeches*. It is singular, that in the whole day, I did not take two trouts out of the same hole. I found both ends, or parts of the brook about equally productive. Small fish not plenty in either. So many hooks get everything which is not hid away, in this manner large trout take care of themselves. I hooked one, which I suppose to be larger than any which I took, as he broke my line, by fair pulling, after I had pulled him out of his den—I was playing him in fair open water.

Of what I send you, I pray you keep what you wish yourself, send three to Mr. Ticknor, and three to Dr. Warren; or two of the larger ones, to each, will perhaps be enough, and if there be any left, there is Mr. Callen-

der & Mr. Blake and Mr. Davis, either of them not "averse to fish."

Pray let Mr. Davis see them, especially the large one. As he promised to come, and fell back, I desire to excite his regrets. I hope you will have the large one on your table.

The day was fine—not another hook in the brook. John Healey as a judge and everything else exactly right.

AN ANGLER OF THE MASHPEE.

I never, on the whole, had so agreeable a day's fishing, tho' the result, in pounds or numbers is not great; nor ever expect such another.

Please preserve this letter; but rehearse not these particulars to the uninitiated.

I think the Limerick *not* the best hook. Whether it pricks too soon, or for what other reason, I found, or thought I found, the fish more likely to let go his hold, from this, than from the old-fashioned hook.

Yrs

D. WEBSTER.

If they hold give Callender a *taste*.

THE SOURCE OF THE MASHPEE.

It has long been a tradition among our Cape Cod trout fishermen that whenever possible Mr. Webster came to these streams for a bit of fishing just prior to the delivery of one of his great addresses. In his oration at the dedication of the Bunker Hill monument, one sentence directed to the survivors of the Revolutionary War there present was, by his own statement, first addressed to two large Mashpee trout lying in his basket. "Venerable men, you have come down to us from a former generation, and a merciful Providence has bounteously lengthened out your lives to behold the glory of this day."

When I first fished Mashpee, some twenty-five years ago, I was shown a beautiful bubbling spring by the side of the road near the lower bridge. "This," said my informant, "is what we call Daniel Webster's spring.

Daniel Webster always took a drink here when he fished Mashpee. I calculate there has been more good Medford rum mixed with the water from this spring than from any other spring in Massachusetts." Needless to say, I at once mixed some for two, and never since have I failed to observe the same religious ceremony at the spot. Tradition also says that Mr. Webster was accustomed to fish in the salt water near the mouth of the river for the early April trout; the Indians had a habit of making a celebration on the beach, clams, oysters, etc., each year on Fast Day. Mr. Webster would take with him a gallon of rum, perhaps not of the same quality he used himself, and give it to the squaws; the skirt dancing that followed would put Loie Fuller or Carmencita to the blush.

Mashpee has its source in a beautiful lake of the same name about three miles long, situated partly in our town of Sandwich, but mainly in Mashpee town. The brook flows for a short distance through open fields and a few small cranberry bogs, then for some five miles through a heavily wooded, narrow valley, where there are many springs along the banks, then there is about one mile of fairly open, boggy meadow, where, though the water is fresh, it can only be fished at low tide, as the high tide backs up the water too deep for wading; then comes about two miles of regular tidal stream, and the river empties into Poponessett Bay, an arm of Vineyard Sound. During its fresh-water course it will average about 15 feet in width, and is fished only by wading; the salt-water part is much wider, and is fished from boats. The entire stream has been preserved for private fishing for many years, but Poponessett Bay and the lake are free and every season give occasional yields of fine fish; the trout, like those in all our tidal streams, are much heavier in proportion to their length than those of the mountain or North Woods streams, very silvery and with very red flesh; as they leave the salt water and go up stream the coloring rapidly becomes more vivid.

Mashpee still flows as clear as ever, unvexed by dam from source to mouth; the wild deer still drink its waters daily. Many a good man has fished it since the day of the "Immortal Daniel," and many a good story could be told thereof if there were space in your paper. The fishing, which for many years was better than in his time, has lately been poorer because the half-breed poachers set gill-nets near the mouth and catch many of the large fish for the market. Now that Massachusetts has passed a law forbidding the sale of all trout except those artificially propagated, let us hope that the old glory of Mashpee will return, and that it will again become, as Mr. Webster calls it, "The chief of all brooks."

JAMES RUSSELL REED.

We take it that the artist who painted the portrait of Webster could have had no thought that he was furnishing material for the illustration of an angling paper; but we may be sure that if the distinguished angler of the Mashpee could have come down to us from a former generation, he would have been nothing loth to lend his portrait to go with Mr. Reed's happy celebration of the charms of his favorite stream. The time has long ago gone by when an angler or a shooter, whatever may be his station in life, need feel any qualms about being identified in the public mind with his chosen recreation. If a man is a good lawyer and a good fisherman as well, the combination of accomplishments is accepted as something highly to his credit; and he need not fear to lose clients thereby.

There is something very appropriate in a portrait of President Roosevelt in his office to accompany a sketch of Mr. Roosevelt as a sportsman. In this country, at least, it is for the most part true that the man who follows with enthusiasm the sports of the rod and the gun, pursues with corresponding energy some branch of work.

We have a leisure class to be sure, but the typical American sportsman—the only one, by the way, for whom it is worth while to endeavor to save the fish and the game—is the man who, whether with hand or head, has some part in the world's work. Most of the contributors, whose signatures, whether real names or pseudonyms, are familiar to the readers of these columns, belong to this class. They make of sport not a profession but a diversion. They play that they may work—or, shall we say, work that they may play? Their letterheads are representative of the varied industries and professions which make up modern society.

For the original print from which the quaint picture of a seventeenth century angler has been reproduced we are indebted to the courtesy of Mr. Russell W. Woodward.

President Roosevelt as a Sportsman.

OF the presidents of the United States not a few have been sportsmen, and sportsmen of the best type. The love of Washington for gun and dog, his interest in fisheries, and especially his fondness for horse and hound, in the chase of the red fox, have furnished the theme for many a writer; and recently Mr. Cleveland and Mr. Harrison have been more or less celebrated in the newspapers, Mr. Harrison as a gunner, and Mr. Cleveland for his angling, as well as his duck shooting proclivities.

It is not too much to say, however, that the chair of the chief magistrate has never been occupied by a sportsman whose range of interests was so wide, and so actively manifested, as in the case of Mr. Roosevelt. It is true that Mr. Harrison, Mr. Cleveland and Mr. McKinley did much in the way of setting aside forest reservations, but chiefly from economic motives; because they believed that the forests should be preserved, both for the timber that they might yield, if wisely exploited, and for their value as storage reservoirs for the waters of our rivers.

The view taken by Mr. Roosevelt is quite different. To him the economics of the case appeal with the same force that they might have for any hard-headed, common sense business American; but beyond this, and perhaps if the secrets of his heart were known, more than this, Mr. Roosevelt is influenced by a love of nature, which, though by some it might be considered sentimental, is, in fact, nothing more than a far-sightedness, which looks toward the health, happiness, and general wellbeing of the American race for the future.

As a boy Mr. Roosevelt was fortunate in having a strong love for nature and for outdoor life, and, as in the case of so many boys, this love took the form of an interest in birds, which found its outlet in studying and collecting them. He published, in 1877, a list of the summer birds of the Adirondacks, in Franklin county, New York, and also did more or less collecting of birds on Long Island. The result of all this was the acquiring of some knowledge of the birds of eastern North America, and, what was far more important, a knowledge of how to observe, and an appreciation of the fact that observations, to be of any scientific value, must be definite and precise.

In the many hunting tales that we have had from his pen in recent years, it is seen that these two pieces of most important instruction acquired by the boy have always been remembered, and for this reason his books of hunting and adventure have a real value—a worth not shared by many of those published on similar subjects. His hunting adventures have not been mere pleasure excursions. They have been of service to science. On one of his hunts, perhaps his earliest trip after white goats, he secured a second specimen of a certain tiny shrew, of which, up to that time, only the type was known. Much more recently, during a declared hunting trip in Colorado, he collected what is perhaps the best series of skins of the American panther, with the measurements taken in the flesh, that has ever been gathered from one locality by a single individual.

Mr. Roosevelt's hunting experiences have been so wide as to have covered almost every species of North American big game found within the temperate zone. Except such Arctic forms as the white and the Alaska bears, and the muskox, there is, perhaps, no species of North American game that he has not killed; and his chapter on the mountain sheep, in his book, "Ranch Life and the Hunting Trail," is confessedly the best published account of that species.

During the years that Mr. Roosevelt was actually engaged in the cattle business in North Dakota, his everyday life led him constantly to the haunts of big game, and, almost in spite of himself, gave him constant hunting opportunities. Besides that, during dull seasons of the year he made trips to more or less distant localities in search of the species of big game not

cook, packer, or what not—sometimes efficient, and the best companion that could be desired, at others, perhaps, hopelessly lazy and worthless, and even with a stock of liquor cached somewhere in the packs—Mr. Roosevelt helped to pack the horses, to bring the wood, to carry the water, to cook the food, to wrangle the stock, and generally to do the work of the camp, or of the trail, so long as any of it remained undone. His energy was indefatigable, and usually he infected his companion with his own enthusiasm and industry, though at times he might have with him a man whom nothing could move. It is largely to this energy and this determination that he owes the good fortune that has usually attended his hunting trips.

As the years have gone on, fortunes have changed; and as duties of one kind and another have more and

more pressed upon him, Mr. Roosevelt has done less and less hunting; yet his love for outdoor life is as keen as ever, and as Vice-President of the United States, he made his well-remembered trip to Colorado after mountain lions, while more recently he hunted black bears in the Mississippi Valley, and still more lately killed a wild boar in the Austin-Corbin park in New Hampshire.

Mr. Roosevelt does not claim to be a good rifle shot. Whether he is so or not, perhaps no one knows. Certain it is that he is handicapped by the use of glasses, which, in certain conditions of weather, must greatly hamper a man in the use of this arm. We may feel sure, however, that he is always cool and steady, that he does not lose his head or become excited, that his nerves are always under control, and finally, and most important of all, that when he hunts he understands the gun that he is using. A hunter of his experience would never attempt to use a rifle without satisfying himself long before he sees his game, just how that rifle must be held to make the bullet reach the desired mark.

Mr. Roosevelt's accession to the Presidential chair has been a great thing for good sportsmanship in this country. Measures pertaining to game and forest protection, and matters of sport generally, always have had, and always will have, his cordial approval and co-operation. He is heartily in favor of the

THE PRESIDENT IN HIS OFFICE.

Photo copyright, 1903, by Waldon Fawcett.

found immediately about his ranch. His mode of hunting and of traveling was quite different from that now in vogue among big game hunters. His knowledge of the West was early enough to touch upon the time when each man was as good as his neighbor, and the mere fact that a man was paid wages to perform certain acts for you did not in any degree lower his position in the world, nor elevate yours. In those days, if one started out with a companion, hired, or otherwise, to go to a certain place, or to do a certain piece of work, each man was expected to do his share of the work.

This fact Mr. Roosevelt recognized as soon as he went West, and, acting upon it, he made for himself a position as a man, and not as a master, which he has never lost; and it is precisely this democratic spirit which to-day makes him perhaps the most popular man in the United States at large.

Starting off, then, on some trip of several hundred miles, with a companion, who might be a guide, helper,

forest reserves, and of the project for establishing, within these reserves, game refuges, where no hunting whatever shall be permitted. Aside from his love for nature, and his wish to have certain limited areas remain in their natural condition, absolutely untouched by the ax of the lumberman, and unimproved by the work of the forester, is that broader sentiment in behalf of humanity in the United States, which has led him to declare that such refuges should be established for the benefit of the man of moderate means and the poor man, whose opportunities to hunt and to see game are few and far between. In a public speech he has said, in substance, that the rich and the well-to-do could take care of themselves, buying land, fencing it, and establishing parks and preserves of their own, where they might look upon and take pleasure in their own game, but that such a course was not within the power of the poor man, and that therefore the Government might fitly intervene and establish refuges, such as indicated, for the benefit and the pleasure of the whole people.

Painting by H. O. Walker, in the Library of Congress.

Wordsworth's Boy of Winander

THERE was a Boy; ye knew him well, ye cliffs
And islands of Winander!—many a time,
At evening, when the earliest stars began
To move along the edges of the hills,
Rising or setting, would he stand alone,
Beneath the trees, or by the glimmering lake;
And there, with fingers interwoven, both hands
Pressed closely palm to palm and to his mouth
Uplifted, he, as through an instrument,
Blew mimic hootings to the silent owls,
That they might answer him—And they would shout
Across the watery vale, and shout again,
Responsive to his call, with quivering peals,
And long halloos, and screams, and echoes loud
Redoubled and redoubled; concourse wild
Of jocund din! And, when there came a pause
Of silence such as baffled his best skill:

Then, sometimes, in that silence, while he hung
Listening, a gentle shock of mild surprise
Has carried far into his heart the voice
Of mountain torrents; or the visible scene
Would enter unawares into his mind
With all its solemn imagery, its rocks,
Its woods, and that uncertain heaven received
Into the bosom of the steady lake.
This boy was taken from his mates, and died
In childhood, ere he was full twelve years old.
Pre-eminent in beauty is the vale
Where he was born and bred: the churchyard hangs
Upon a slope above the village school;
And, through that churchyard when my way has led
On summer evenings, I believe that there
A long half-hour together I have stood
Mute—looking at the grave in which he lies!

We had two horses.

We were short of water and we looked for a creek.
We reached it and drank, and a little bird came near and
sang, "Well! well! well!"

Then he sang "He! he! he!"

That little bird made us merry. Then we all laughed.
If anybody passes this trail, don't get low spirited.

If a man gets low spirited he may get sick.

I say that for everybody.

JOE.

As a check on the accuracy of the translation, I offer
an exact copy of the original which omits only the flat
and unprofitable advice at the end.

As if we got a sick tum tum on purpose!

Now there is a truthful story of simple men.

I imagine this half dozen of Indian hunters, weary
exceedingly, out of meat and short of water. (I hard-
ly see how they could have missed water far in such
a network of streams, but the stump says "short of
water.") They reach the creek, drink eagerly and go
to bed for three days with a "sick tum-tum." This
might have been the result of over-drinking or under-
eating, or the use of roots that give a most unat-
tractive kind of starch to the Indian diet, or, perhaps, they
were bed-ridden by reason of unseasonable rains or
mere dark depression. On this point the stump is
silent. Then comes the halcyon bird, harbinger of bless-
ings, and he laughs to them, "Well! Well! Well! He,
He, He!" and they all laugh together, and their rifles
bring down game, and they eat abundantly, and dry
their surplus meat (we saw their drying scaffolds), and,
as a guide to the wayfarer, they tell the story of the
stump and draw the moral:

Excellent men!

And now we, too, began to gather fruits of the
chase; fool hens that were stoned to death, grouse,
rainbow trout, goats and deer.

The trout were caught in a small lake with bait.

One of them weighed about 2 pounds, others a quar-
ter as much. The salmon colored band on the flank
was bright and their red flesh was firm and good.
The deer, though proclaimed a tremendous fellow by
the Indians, did not rank with mule deer that I have
seen in Wyoming and Idaho. The spread of his horns
was only 19 or 20 inches, and they were neither heavy
nor long. A similarly disappointing smallness was
noticeable in the ram's horns brought in by three par-
ties out of many that went hunting this autumn. Four-
teen inches around the base and 33 inches on the outer
sweep, were considered large dimensions. This is a
matter of the tape line and cannot be laid to a senti-
mental exaggeration of the glories of vanished
times.

Either the big fellows have learned caution or the
game, harassed by continual pursuit, does not have
time to grow big.

Goats did not entirely satisfy our ambitions, and
we crossed the Bridge River and followed it down
looking for sheep grounds, unoccupied by other hunt-
ers, where we would not be spoiling someone else's
sport.

To one acquainted only with the upper reaches of
the Bridge River, it would seem to have earned its
name from having two rope ferries and numerous fords.
But I am told that there is a fine government structure
at the river's mouth, which replaced the Indian bridge
that spanned and gave a name to the stream when the
miners first poured in.

The Indian bridge was made on a plan, of which
some specimens still remain in other places. Trees
trimmed of their branches were supported and weighted
by stone piles on the opposite side of the river in such
a way that their small ends projected toward one an-
other and left only a moderate gap to span. A long

stick of timber was then lashed to the ends to fill the
gap and then the passer, with one foot on either tim-
ber, just skated or shuffled along the two parallel sticks
as best he might, on so uncertain a footway.

Horses were always taken across by swimming or
fording in Indian times. And in one unaccustomed to
this kind of engineering I am told that great strength
of will was required to make the crossing, though an
old squaw, or kloochman, as they call her, would trudge
across with a heavy load on her back without a sign
of hesitation. The old timers speak of the plan of the
Indian bridge as the cantilever principle. At all events,
its construction showed mechanical ingenuity and en-
terprise.

When we had made one or two fruitless halts for
hunting along the Bridge River, my holiday time came
to an end, and I turned from the diapason of the pines
and the song of falling waters to the rattle of ordinary
existence.

The chief of the Lillooets agreed to drive me out
to the railroad, and he did it worthily, though much
against his will, for it was raining hard, and he told
me that nothing but his pledged word would have made
him take that uncomfortable drive. The day I spent
with him was full of interest. He was a fine-natured,
broad-minded man. A linguist speaking Shuswap,
Thompson River, English, Lillooet, a little Spanish,
Chinook and I know not what other jargon. In spite
of his accomplishments, he said that there were too
many languages, one ought to suffice, and he con-
sented that English should be that one. His English,
indeed, was fine; not Major's glorified baby talk, nor
Aleck's terse mumble, but idiomatic, weighty, reason-
able, and I sat literally at his side, but metaphorically
at his feet, learning some little part of the secret of the
hills.

H. G. DULOG.

The Albatross at Home.

THERE has recently been published in the U. S. Fish Commission Bulletin for 1903, an extremely interesting paper by Walter K. Fisher, on the Birds of Laysan and the Leeward Islands of the Hawaiian group.

Many of these Leeward Islands, lying far to the west of Hawaii, are mere rocks, and are sometimes known as Bird Islands. Mr. Fisher's sojourn among them was brief and undertaken in the summer of 1902. He spent a week on Laysan, which is about 800 miles from Honolulu, and there made the interesting observations included in this paper. Although the number of sea fowl there is enormous, the species breeding are few, there being but 23, of which 18 are sea fowls, and 5 land birds, including a rail and a duck. A new species of tern was discovered on one of these islands. The region is not untouched ground for the ornithologist, for its bird fauna has been covered by the observations of a number of students, from 1891 down to the present time.

The U. S. F. C. S. S. Albatross left Honolulu for Laysan May 10, and on May 15, while still distant 75 miles from the island, began to meet the sea birds which are found there. Laysan is a small island 3 miles long by $1\frac{1}{2}$ miles broad, and at its highest portion not more than 30 feet above the sea. It is considered to be an old atoll, which has been elevated, and its vegetation is very sparse. On it are a lagoon of salt water, which, however, is not connected with the sea, and a little pond of fresh water.

The island is a vast breeding ground for birds; terns, albatrosses, puffins, gannets, man-o'-war birds and petrels. Birds are everywhere, and the noise is sometimes deafening. "When we made our way through a populous colony of sooty terns we had to exercise much care to avoid crushing their eggs and treading on the birds, which struggled panic stricken before us, with the old ruse of a broken wing, and then taking flight, swarmed over our heads. If we would converse it was necessary to shout." Portions of the island, where there was soil, were completely honey-bombed with the burrows of petrels, and in walking over this the pedestrian constantly broke through the roof of these tunnels, sinking in the soft soil up to the knees.

"Few of the birds seemed frightened, and with the exercise of a little care, we were able to approach most of the species as close as we wished. It was certainly gratifying to be able to walk up to an albatross or a booby and watch it feed its young and to record this domestic duty with a camera. It might perhaps be difficult to convey the pleasure I experienced, when, standing in a group of albatrosses, one came up and peered into my face, and finding my intentions good, proceeded to examine inquisitively the polished top of my tripod. Many of the young albatrosses would allow themselves to be stroked after a ludicrous show of displeasure, and would soon appear as if they had known us always. The little rails scampered hither and thither like diminutive barnyard fowls, but soon returned, craning their necks to discover why they had retreated. When we sat working, not infrequently the little miller bird came and perched for a moment on our table and chair backs, and the laysan finch and rail walked about our feet in busy search for flies and bits of meat. The beautiful little honey eater visited us each day at meal time, and sought for 'millers' in the panels and seams between the boards. Thus, wherever we went we were free to watch and learn, and were trusted by the birds. It seems a touching and unique experience, and one which demonstrates all too forcibly the attitude of wild creatures which have not yet learned that man is usually an enemy."

Although Laysan, where most of these observations were made, is low and flat, others of these rocks, such as Necker Island and Bird Island, are high and precipitous; the latter rising over 900 feet into the air.

The Necker Island tern (*Procelsterna saxatilis*), described by Mr. Fisher in the Proceedings of the U. S. National Museum for 1903, was found breeding on Necker Island, where it was abundant. It was also seen about Bird Island, but here, owing to bad weather, no landing could be made. How wide the distribution of the species may be we do not know; but an allied species is found over much of the South Pacific.

One of the interesting, abundant and remarkable birds of Laysan is the albatross named from the island, called also Gony. Of these there is an immense colony, occupying the flat plains surrounding the lagoon, where one can see, at a single view, many thousands of the birds. Indeed, there seems scarcely a tussock of the grass over the greater portion of the slopes of the island, but has a young bird in its shadow, ready to snap at the passerby with an appearance of ferocity. When approached they seem to become angry, lean forward and snap their beaks viciously, or may even make a rush, waddling along, and darting the heads

FAVORITE GAME IN FIRST STAGE.

SECOND STAGE OF FAVORITE GAME.

USUAL FINISH OF GAME.

FINISH OF THE SONG DANCE.

back and forth to the music of clicking mandibles. Usually, however, they can be coaxed into good nature, and may be handled easily.

"The old birds, however, are quite different, and do not seem to mind the presence of man. One can walk among them without disturbing their various occupations and movements in the least. Only when suddenly startled do they exhibit any tendency to snap their bills, and then they are easily calmed. They back away from any proffered familiarity with great rapidity, unless suddenly hindered by a tuft of grass, which event surprises them immoderately. They will not allow themselves to be handled, and make off at a great rate if one offers them this indignity. They have a half doubting inquisitiveness which leads them sometimes to walk up to the visitor and examine anything conspicuous about his person. One bird became greatly interested in the bright aluminum cap to my tripod, and strolled up and examined it carefully, with both eye and beak, appearing somewhat astonished when the cap tinkled.

"When standing beside their young they present a very attractive sight, as their plumage is always immaculately clean. The region about the eye is dark-grayish, overhung by a pure white eyebrow, which gives them a decidedly pensive appearance. They have an innate objection to idleness, and, consequently, seldom stand around doing nothing, but spend much time in a curious performance, the meaning of which I am at a loss to explain. It has been called courting (Avifauna of Laysan, etc., p. 57), but as the antics are carried on during the bird's residence of about ten months on the island, they are probably an amusement, in which the albatrosses indulge immoderately in lieu of other diversions. This game, or whatever one may wish to call it, may have originated in past time during the courting period, but it certainly has long since lost any such significance.

"The proceeding in brief is as follows. Two albatrosses approach each other bowing profoundly and stepping rather heavily. They circle round each other nodding solemnly all the time. Next they fence a little, crossing bills and whetting them together, pecking meanwhile, and dropping stiff little bows. Suddenly one lifts its closed wing and nibbles at the feathers underneath, or, rarely, if in a hurry, merely turns its head and tucks its bill under its wing. The other bird during this short performance assumes a statuesque pose, and either looks mechanically from side to side or snaps its bill loudly a few times. Then the first bird bows once and, pointing its head and beak straight upward, rises on its toes, puffs out its breast, and utters a prolonged nasal groan, the other bird snapping its bill loudly and rapidly at the same time.

"Sometimes both birds raise their heads in the air, and either one or both utter the indescribable and ridiculous bovine groan. When they have finished, they begin bowing at each other again, almost always rapidly and alternately, and presently repeat the performance, the birds reversing their role in the game, or not. There is no hard and fast order to these tactics, which the seamen of the Albatross rather aptly called a 'cake walk,' but many variations occur. The majority of cases, however, follow the sequence I have indicated. Sometimes three engage in the play, one dividing its attention between two. They are always most polite, never losing their temper or offering any violence. The whole affair partakes of the nature of a snappy drill, and is more or less mechanical.

"Occasionally one will lightly pick up a twig of grass and present it to the other. This one does not accept the gift, however, but, thereupon returns the compliment, when straws are promptly dropped and all hands begin bowing and walking about as if their very lives depended upon it. If one stands where albatrosses are reasonably abundant, he can see as many as twenty couples hard at work bowing and groaning on all sides, and paying not the slightest attention to his presence. When walking through the grassy portions of the island, I have seen white heads bobbing up and down above the green, as solitary pairs were amusing themselves away from the larger congregations of their kind. If I walked up to them they would stop and gaze in a deprecating way and walk off, bowing still, with one eye in my direction. Having reached what they considered a respectful distance, they would fall to and resume their play.

"Should one enter a group of albatrosses which have been recently engaged in this diversion and begin to bow very low, the birds will sometimes walk around in a puzzled sort of way, bowing in return, a curious fact, which F. H. von Kittlitz recorded early in 1834:

"When Herr Isenbeck met one, he used to bow to it, and the albatrosses were polite enough to answer, bowing and cackling. This could easily be regarded as a fairy tale; but considering that these birds, which did not even fly away when approached, had no reason to change their customs, it seems quite natural."

(Concluded on Page 442.)

ANGLING IN THE SEVENTEENTH CENTURY.

From the "Gentleman's Recreation," published in the year 1886.

THIS is a *fac-simile* of one of the plates in Blome's "Gentleman's Recreation," printed by Roycroft in 1686, or thirty-three years after the first edition of Izaak Walton's "Compleat Angler." The work treated of horsemanship, hawking, hunting, fowling, fishing and agriculture. It comprised also a treatise on cock-fighting. Blome's inclusion of the pastime of the pit as one of the recreations of a gentleman indicates that the sportsman of the seventeenth century was possessed of more catholicity of taste than his brother of

the twentieth century. Times change; sentiment, fashions, sports change with them. Of all the popular recreations of Blome's day, none has held its place more securely than angling; no other, if we may judge by the persisting taste of sportsmen, is likely to endure longer in the favor of mankind. There may come a time when for a Christmas Number of some FOREST AND STREAM of the twenty-fourth century there shall be drawn from the angling prints of 1903 something which to the eye of the reader of that time shall seem

as quaint and old-fashioned and crude as this Blome print does to us. But of this we may be certain, that in whatever costume he shall array himself, with whatever tackle he shall angle, and whatever fish he shall draw forth, the angler of that day will be animated by the spirit of the angler now; and the gentle art will have for him the same allurements and the same compensations it had for the fisherman of Blome's day and has for us. Times may change, but the compelling charm of angling will last while sun shall shine and waters run.

THE ALBATROSS AT HOME.

(Concluded from Page 440.)

"One moonlight night we strolled over the island after nocturnal petrels and visited a portion of a populous albatross colony. The old birds were still hard at work executing their queer 'song dance,' and in the uncertain light the effect was one long to be remembered. Their white plumage made them conspicuous for a long distance over the stretches near the lagoon. From all sides the sound of their groans and bill-

ALBATROSS FEEDING YOUNG—FIRST STAGE.

snappings was audible above the continual thin, high squeak of young albatrosses and the moans and caterwauling of shearwaters and petrels. During some quieter spell in the activities of the vocalists faraway groans were borne to us across the placid lagoon, as a reminder that in other parts the good work was still going on. By this time many of the albatrosses had started off fishing, as they seem to do a large part of it after dark, probably toward morning.

"It is interesting to note that the antics which have just been described are not limited to this species, but in a modified form are practiced by others. Probably all species of the genus exhibit the trait in some form.

"After sunrise the albatrosses begin to feed their young. The old bird, coming in from the sea, alights near her offspring, which immediately takes the initiative by waddling up and pecking or biting gently her beak. This petitioning always takes place and perhaps acts as some sort of stimulus, for in a few moments the mother stands up, and with head lowered and wings held loosely at the side, disgorges a mass of squids and oils. Just as she opens her beak the young inserts its own crosswise and skillfully catches every morsel, which it bolts down with evident relish. This operation I saw repeated, with short intermissions, ten times. The last

SECOND STAGE OF FEEDING YOUNG.

two or three ejections of this oily pabulum cost the albatross considerable muscular effort, and the last time nothing came up but a little oil, and stomach juices presumably. The young bird is not at all modest in its demands, but keeps asking for more. The old bird now pecks back in an annoyed manner, and if the other still urges, she arises and walks off, usually to some neighboring young one, which she viciously mauls about the neck. This exhibition usually takes place just before she feeds her young and likewise between courses, as it were. Why she does this I am at a loss to suggest, unless it be mere ill will. The old bird does not always confine this ill treatment to one strange young bird, but takes in a circle of those whose parents are absent. The young thus rudely treated sometimes bite back, but usually do not offer resist-

ance, uttering instead a plaintive little squeak. A small mortality is the result of this practice. Dr. Gilbert observed that *Diomedea nigripes* is more savage than the white species. He saw a black-footed albatross thus take in a circle of about twenty young *immutabilis* and 'wool' them soundly. Finally, however, the ruffian arrived at a youngster whose parent, being unexpectedly nearby, set upon the persecutor, and in the scrimmage *nigripes* was put to rout."

Near the resting places of the young—one could hardly call them nests—are often found solid pellets made up of the beaks and opaque lenses of the eyes of squids, no doubt disgorged by young or old birds, as hawks and owls disgorge the undigestible portions of their food. Certain large seeds, which had probably been through the same course, were also found on the island, for, as is well known, the albatrosses pick up and swallow many floating things not adapted to their food, and these large seeds, known as candle nuts, are often seen floating in the ocean. The nearest trees on which they grow are about 700 miles east from Laysan. The observation suggests one means by which many hard, floating seeds might be carried into the interior of islands, and there find a soil favorable to their germination.

The visit of the investigators was happily timed. No less than 18 of the 23 species were breeding, some having eggs, others young, and some both. It was found that many of the species bred by colonies, choosing special localities for their nests and breeding only in these localities. The blackfooted albatross breeds on the sand beaches, and on the northeast and south sides of the island, but not elsewhere. The blue-faced gannet confines itself to the narrow littoral sedge-covered slope on the same sides, the gray-backed tern breeds higher up, and so, as a rule, each species has its own

FINAL STAGE OF FEEDING YOUNG.

locality. It is interesting to note that the birds visiting the island do not all breed at the same time. There is not space enough for them to do so, and as noted by an earlier observer, they are obliged to take turns; so that some species of sea birds leave the place as soon as their young are strong enough to fly, and just at this time other newcomers are arriving at the island. "Thus there is a constant coming and going, and it follows that breeding species are found at almost every season of the year, a fact which is remarkable even in the tropics, where the breeding season is less regular than in our latitude. In this way a most definite succession, which probably dates back thousands of years, takes place year after year in the arrival and departure of certain species."

The Labrador Duck.

A Wild Fowl that has Disappeared.

THE Labrador duck *Camptolaimus labradorius* (Gmel.) is one of the two or three North American birds that have become extinct within historic times.

To the earlier ornithologists it was a well-known species of the Atlantic coast, and yet, from the way in which they write, we may assume that it was never very common, for Giraud says, "With us it is rather rare," and speaks of it as a bird "chiefly inhabiting the western side of the continent," leaving it to be inferred that there were places where it was more abundant than on the Atlantic. Wilson calls it "rather a scarce species on our coasts."

Audubon, on the other hand, writing a few years earlier than Giraud, says, in the fourth volume of the Ornithological Biography, published in 1838, "The range of this species along our shores does not extend further southward than Chesapeake Bay, where I have seen some near the influx of the St. James River. I have also met with several in the Baltimore market. Along the coast of New Jersey and Long Island it oc-

curs in greater or less numbers every year. It also at times enters the Delaware River in Pennsylvania, and ascends that stream at least as far as Philadelphia. A bird stuffer, whom I knew at Camden, had many fine specimens, all of which he had procured by baiting fish-hooks with common mussels, on a trot-line, sunk a few feet beneath the surface, but on which he never found one alive, on account of the manner in which these ducks dive and flounder when securely hooked. Of the specimens which I saw with this person, male and female were in perfect plumage, and I have not en-

YOUNG ALBATROSS POSING FOR ITS PICTURE.

joyed having opportunities of seeing the changes which this species undergoes.

Audubon supposed that members of his party saw the nests of the pied duck on the Labrador coast, in 1833, but as these nests were deserted, and were only identified by the report of the clerk of the fishing establishment there, it may well enough be that they belonged to some other species. They are described as being like those of the eider duck; and perhaps may have been nests of that bird.

The Labrador duck was nearly related to the common old-squaw or long-tailed duck, which it somewhat resembled in color, as will be seen by the plate. Like the eider duck, on the other hand, to which also it is closely related, it had a patch of curious bristly feathers on the cheeks, and also a soft, membranous expansion of the upper mandible of the bill, next to the head. Wilson quaintly says of the bill, "toward the extremity it widens a little, in the manner of the shovelers, besides having the singularity of there being only a soft, loose, pendulous skin." The bill between the nostrils is pale grayish-blue, the sides of the breast, and the edges of both mandibles are dull orange, and the point of the bill is black. Young males are said to have the whole of the white plumage tinged with yellowish cream color. The female is ashy-gray, darker be-

GROUP OF MAN-O'-WAR BIRDS.

neath and with the secondaries white, the tertiaries grayish, and a bar across the wing, formed by the white secondaries.

The extinction of the Labrador duck is very recent, the last specimen known having been taken in the year 1878. Audubon speaks of them in his time as being hardy birds, and met with along the coasts of Nova Scotia, Maine and Massachusetts, during the most severe cold of the winter. He says that "The pied duck seems to be a truly marine bird, seldom entering rivers unless urged by stress of weather. It procures its food by diving amidst the rolling surf, over sand or mud bars, although at times it comes along the shore, and searches in the manner of the spoon-bill duck. Its usual fare consists of small shellfish, fry and various kinds of seaweeds, along with which it swal-

lows much sand and gravel. Its flight is swift, and its wings emit a whistling sound. It is usually seen in flocks of from seven to ten, probably the members of one family."

Of the two specimens figured in the plate, Audubon says, "The Hon. Daniel Webster, of Boston, sent me a fine pair killed by himself, on the Vineyard Islands, on the coast of Massachusetts, from which I made the drawing for the plate before you."

It is interesting to note that these two specimens are still preserved in the Smithsonian Institution, in Washington.

It was not until the very last years of the existence of this species that its rarity came to be realized. As soon, however, as this began to be suspected, every effort was made to secure and preserve specimens that became accessible. In his "American Duck Shooting" Grinnell says:

"The pied duck was a strong flier and apparently well able to take care of itself, and its practical extinction took place before gunning was practiced on any very great scale. It was not especially sought for as a table bird, and no satisfactory reason has as yet been advanced for its disappearance. * * * A very beautiful group of Labrador ducks is to be seen in the American Museum of Natural History, in New York, where five specimens have been handsomely mounted in their natural surroundings."

A few years ago Mr. William Dutcher, so well known for his study of the birds of Long Island, and still more widely for the faithful and long-continued work that he has done toward protecting the native birds of America, published in the Auk, three papers on the known specimens of the Labrador duck, from which we take a number of facts and paragraphs.

Mr. Dutcher's first paper appeared in April, 1891, and subsequent papers in January and April, 1894. His investigations have increased the number of known specimens of this species from 33 to 42, of which, however, some have been lost. These specimens are divided as follows:

The British Museum has two.....	2
The Liverpool Museum has three.....	3
The Strickland collection, Cambridge.....	1
Colonel Wedderburn's collection.....	1
The Leyden Museum.....	2
The Berlin Museum.....	1
The Paris Museum of Natural History.....	1
American Museum of Natural History.....	7
Long Island Historical Society, Brooklyn.....	1
Vassar College, Poughkeepsie, N. Y.....	1
University of the State of New York, Albany.....	2
To these must be added a male, now in the possession of Mr. William Dutcher, and one in the hands of Mr. John Lewis Childs.	
Collection of William Brewster, Cambridge, Mass..	2
Collection of Charles B. Corey, Boston, Mass.....	2
Collection of Gordon Plumber, Boston, Mass.....	1
Boston Society of Natural History.....	1
U. S. National Museum, Washington, D. C.....	4
Academy of Natural Sciences, Philadelphia.....	3
University of Vermont, Burlington.....	1
Collection of Dalhousie College, Halifax, N. S.....	2
Museum of Natural History Society of Montreal....	1
Total in Canada, 3.	
Total known in Europe, 11.	
Total known in North America, 31.	

Besides these some specimens have since been recorded and some have been lost. One of these was a male, obtained by Mr. William Winton, of Halifax, by him given to Andrew Downs, and by him to Mr. Geo. A. Boardman, and afterward destroyed, because eaten by mice and moths.

A female was received from Mr. Cheney by Mr. Harold Herrick, in the year 1871, by him turned over to Mr. Boardman, who sent it to John Wallace, of New York, to be mounted, and by Wallace it was lost.

A specimen was recorded by Dr. W. H. Gregg, of Elmira, N. Y., in 1879; it was shot by a lad in December, 1878, and had been eaten before Dr. Gregg learned of its capture. He did, however, secure the head and a portion of the neck, thus identifying the bird. This fragment has since been lost.

Mr. John Lewis Childs recently purchased from the Liverpool Museum a male Labrador duck, perfect and in full plumage. It was acquired by Lord Derby in January, 1833, and bequeathed to the Liverpool Museum in 1853.

In 1893 a heretofore unrecorded specimen of the Labrador duck was discovered in the Museum of Natural History Society of Montreal, by Mr. Ernest D. Wintle, of Montreal, Canada, and was brought to the notice of Mr. Dutcher. It is a young male, and nothing is known as to the history of the skin. Again, in 1894, Mr. Dutcher—once more through the kindness of Mr. Ernest D. Wintle, of Montreal, Canada—called attention to a record of the Labrador duck in the "Canadian Naturalist and Geologist" for 1862. The bird is described, and the note which follows the description

adds, "A specimen of this beautiful duck, the first which I have seen, was shot in the Bay of La Prairie, this spring (1862) by a habitant, and was purchased by Mr. Thompson, of this city, who has kindly placed it at my disposal for examination. I believe it to be one of the rarest of our visitants of this species, and to demonstrate that an acquaintance with our fauna must be a work of many years." This specimen is the one which afterward passed into the possession of Mr. Dutcher, and is the forty-second specimen known of this species.

Mr. Dutcher gives some interesting historical notes on this species. Most of them are from the pen of ornithologists of an earlier generation, some of whom are now dead.

Mr. Geo. N. Lawrence, in January, 1891, wrote, "I recollect that about forty or more years ago it was not unusual to see them in Fulton Market, and without doubt killed on Long Island. At one time I remember seeing six fine males, which hung in the market until spoiled, for the want of a purchaser; they were not considered desirable for the table, and collectors had a sufficient number at that time, a pair being considered enough to represent a species in a collection. No one anticipated that they might become extinct, and if they have, the cause thereof is a problem most desirable to solve, as it was surely not through man's agency, as in the case of the great auk."

In November, 1891, Mr. Thos. I. Egan, of Halifax, Nova Scotia, said, "I believe this duck is now extinct. My business is dealing in game, and I see many of the fishing people from Newfoundland. I believe if any odd birds were seen that I would hear about them. The name 'pied duck' is now applied to the surf scoter, by many of the gunners from Labrador, Newfoundland."

Colonel Nicholas Pike, of Brooklyn, N. Y., said in 1891: "I have in my life shot a number of these beautiful birds, though I have never met more than two or three at a time, and mostly single birds. The whole number I ever shot would not exceed a dozen, for they were never plentiful; I rarely met with them. The males in full plumage were exceedingly rare; I think I never met with more than three or four of these; the rest were young males and females. They were shy and hard to approach, taking flight from the water at the least alarm, flying very rapidly. Their familiar haunts were the sandbars, where the water was shoal enough for them to pursue their favorite food, small shellfish. I have only once met with this duck south of Massachusetts Bay. In 1858 one solitary male came to my battery, in Great South Bay, L. I., near Quogue, and settled among my stools. I had a fair chance to hit him, but in my excitement to procure it, I missed it. This bird seems to have disappeared, for an old comrade, who has hunted in the same bay for over sixty years, tells me he has not met with one for a long time. I am under the impression the males do not get their full plumage in the second year. I would here remark, this duck has never been esteemed for the table, from its strong, unsavory flesh."

Mr. Geo. A. Boardman wrote from Calais, Me., in the autumn of 1890: "I began to collect birds about fifty years ago, and wanted to get a pair of each species; I did not care for more. The Labrador duck I procured without much trouble, and if I had any duplicates sent to me, I did not save them any more than I should have saved duplicates of scoters or old squaws, I have no doubt but that I may have had others. I had shooters all about the coast of Grand Manan and Bay of Fundy, sending me anything they knew was odd. Anything they sent to me that I already had mounted generally went into the manure heap. About twenty years since, Messrs. John G. Bell and D. G. Elliott, of New York, wrote to me to try to get them some Labrador ducks. I wrote to all my collectors, but the ducks had all gone."

Mr. Dutcher's dates of the capture of certain specimens have been questioned by at least one British naturalist, but there seems no question but that Mr. Dutcher has the facts and figures to prove all that he has alleged on these points. The testimony as to birds collected between 1857 and 1871 seems ample, and is advanced by such witnesses as Mr. Lawrence, Mr. Elliott and Mr. Vickary. Mr. Lawrence had absolute faith in the specimen now in the Smithsonian Institution, bearing the label, 1875.

Of this bird killed in 1875, Mr. Dutcher very justly says that it must have had parents, and that there probably were other young ones in this brood. Since then, except for the great specimen of 1878, nothing has been seen of the Labrador duck.

In the hope of learning something as to the existence of the bird, Mr. Dutcher sent copies of the plate of the Labrador duck, which appeared with his first paper, to the north with two Arctic exploring expeditions, neither of which brought back any information about the bird.

Mr. Langdon Gibson, who accompanied the Peary expedition to Greenland, showed his plates to French-

Canadians, on the Straits of Belleisle, but they declared that they had never seen such birds. The leading hunters at Godhaven, Disco Island, Greenland, made the same statement, but the Esquimaux on McCormick Bay declared that these birds were abundant, and said that in the spring many could be had, with their eggs, at the head of the bay they were camped on. But, unfortunately, when spring came, the promised Labrador ducks proved to be old squaws. In August, 1892, on the way home, the party touched at Godhaab, the largest town in Greenland. Here Herr Anderson, the Danish inspector of South Greenland, an accomplished naturalist, has a fine collection of Arctic birds. He told Mr. Gibson that his collection represented twenty years' work, and that all the hunters in South Greenland had instructions to bring him any strange birds that they might get, and that in this way he had added to his collection from time to time many rare birds and eggs, but in all that time he had heard nothing of the Labrador duck. Proof sufficient, one would think, that within the last twenty years the Labrador duck had not visited Greenland.

There has been much speculation as to the cause of the disappearance of this beautiful bird, and, perhaps, no one has written so fully about it as Mr. Frederic A. Lucas, of the Smithsonian Institution, in his paper on Animals Recently Extinct, or Threatened with Extinction, as Represented in the Collections of the U. S. National Museum. Mr. Lucas suggests that some epidemic may have swept off the greater part of the race, but this is wholly conjectural, for nothing of the kind is known to have occurred. We do know, however, that epidemics occur among birds, for Dr. Stejneger has given us an account of a case of this kind in the Commander Islands, where many thousands of pelagic cormorants died during the winter of 1876-77, so that dead birds covered the beaches all around the islands. This destruction, however, did not permanently injure the supply of these birds, which have since greatly increased.

Mr. Lucas suggests, also, that if the Labrador duck had a limited breeding area in the north, which was near the summer camp of a band of Indians, the destruction of their eggs might have worked largely toward the extinction of the species.

It is quite possible that we shall never know what it was that destroyed the Labrador duck, and speculation about it is vain. It is worth while, however, to quote what Dr. Stejneger has said, in the volume of the Standard Natural History, devoted to birds, to show how the extinction of this species, or, indeed, of any other, might come about.

"It seems to be a fact that when a migratory species has reached a certain low number of individuals, the rapidity with which it goes toward extinction is considerably increased.

"Two circumstances may tend toward this result. We know that when birds on their migrations get astray, having lost their route and comrades, they are nearly always doomed to destruction, that fate not only overtaking single individuals, but also large flocks to the last member.

"If the safety of the wanderers, therefore, greatly depends upon their keeping their correct route, the safety decreases disproportionately the scarcer the species become, since, if the route is poorly frequented, the younger and inexperienced travelers have less chance of following the right track, and more chance of getting lost, and consequently destroyed. The fewer the individuals, the more disconnected become the breeding localities, the more difficult for the birds to find each other and form flocks in the fall. Finally, the number will be reduced to a few colonies, and the species, consequently, in danger of extinction, and a casualty, which, under ordinary circumstances, would only affect a fraction of the members, now may easily prove fatal to the remainder of the species.

"We need only suppose that during one unfortunate year nearly all the broods were destroyed by inundations, fires, or frost, to perceive what difficulty the few birds left in the autumn would have in wending their way without getting astray.

"We know that the proportion of birds returning in spring is comparatively small, and the flocks are considerably thinned down.

"Under the circumstances presumed, there will hardly be birds left to form flocks. But birds used to migrate in flocks do not like or cannot travel alone; hence they are forced to follow flocks of allied species, which may take them to localities far from their home. In that way a few scattered pairs may survive, and breed here and there, a number of years after the rest are destroyed, and such are probably those few Labrador ducks which have been captured occasionally during the last twenty years or more.

"There is a possibility that a few such pairs may be in existence, but, however hardy, their fate is sealed, and perhaps not a single one will get into the hands of a naturalist."

Some Snakes I Have Met.

I.—The Kentucky Copperhead.

Down in the beechwoods the heat was oppressive, and the four gray squirrels which I had acquired up in the hills, where the ripe mulberries were so attractive, were pulling down heavily, so I decided to take off my coat and swing it from my belt. Stepping to a nearby vine-grown tree, I was in the act of leaning my old muzzleloader against the tree, when I became suddenly chilled with horror by the sight of a huge, brownish, yellow snake. The upper part of his body protruding from the vine on the side of the tree was curved outward, the head pointed straight at and level with my eyes but a few inches away. I stared stupidly for one or two full seconds, taking in every feature, his partly opened mouth, the quickly playing red tongue, the gentle swaying of the poised head. Then my senses suddenly returned, and I dropped, or rather threw myself, backward, involuntarily retaining my hold on the gun. Scrambling quickly to my feet from where I had fallen sprawling on my back in the leaves, I started for the clearing, but turned at twenty feet, and decided to defend myself, no matter how great the peril. The copperhead had scarcely moved, but still swayed in the air, sharply outlined against the background of deep green. Despite my great fright, I held the sight steadily on the swaying head. With cool and deliberate aim, not satisfied with one charge, I poured the contents of both barrels at the head of that serpent, and the effect was to obliterate the forward portion and completely tear off the head.

Then I again lost my nerve, or, perhaps, it would be more accurate to say that I found my nerves, for I suddenly began to tremble violently, so that it was with great difficulty I proceeded with reloading my gun. I wasted much powder, for I could scarcely hold the powder horn, and when it came to shot, it seemed as if as many of the precious pellets pattered on the leaves as went down into the yawning muzzle. At this stage the interwoven body of the dead snake began to relax, and in a minute fell into the dry leaves with what seemed to me a loud crash. This was the final shock to my shattered nerves; and dropping the gun, I burned the wind in the direction of the clearing. If a stop-watch could have been held on me then I might have won the fame that afterward carefully eluded me on the cinder path.

Years after this incident I saw nothing to make me proud of my share in the action; for the copperhead certainly had the drop on me, and declined to shoot; but as a boy of fourteen, I felt few pangs of remorse.

II.—The Arkansas Water Moccasin.

One bright, hot morning in July, up four miles from the mouth of Mulberry creek, in the western part of Arkansas, five of us sat on the broad gunwale of a small flat bottom boat, which was being poled up the stream toward the swimming hole. We were garbed in a costume said to have been fashionable at the time when Eden flourished, and as this was six years after my adventure with the copperhead, I had grown very bold and brave in dealing with snakes. With a good deal of mirth and tuneless singing, my boyish companions were pushing the boat rapidly through a placid reach of dead water. They had little regard for direction, and presently they jammed the square bow of the boat with considerable force into the root wad of an upturned tree. The shock of the collision dislodged a large water moccasin, which had doubtless been taking a morning nap in the warm sunshine, far up on the matted roots of the tree. When he fell squarely into my lap he was a much surprised serpent. I was somewhat astonished myself. I felt the weight of his heavy body, the movement of his sinuous folds as he writhed about, his head erect, growing angrier every second. He seemed to pay more attention to my companions than to me. I had no particular desire to nourish him in my bosom, and when he turned his ugly head upward toward my face, and I saw the white cotton-like interior of his mouth, I thought it about time to thrust him from me, and accordingly I threw him with considerable force against the bottom of the boat. The snake came right back, but I did not wait. I felt that I had done my full duty toward him. By this time the boat was deserted, with the exception of a small crippled lad, who had sat near the stern of the boat, his white, pinched face showing much amusement at the antics of the chattering "white monkeys," whose brawny bodies he seemed to admire.

It seems that as soon as all of us able-bodied cowards jumped into the water the moccasin turned his attention to the boy. The youth told me afterward that his first impulse was to scoop the snake on the blade of an oar and throw it into the midst of us as we swam away, but he said he knew of the deadly nature of the moccasin and that the snake had the reputation of biting with fatal effect while swimming, so he changed his mind. The battle lasted but a few min-

utes, and then with calm deliberation the pale youth threw our clothes overboard, and announced that if anyone dared come near the boat he would throw the copperhead in his face. We watched him as the boat drifted slowly around the bend below us, and then we gathered up what clothing we could find, and barefooted and ashamed, started on our silent march of three miles to town. There was no mirth and singing. I have never been able to figure out why the copperhead spared me, for he surely had the drop on me, and he declined to shoot.

III.—The California Rattlesnake.

Last Christmas I had my first experience shooting California valley quail, also my first experience with a California rattlesnake. Mr. E. B. Collier, of Corona, Cal., who annually assists Santa Claus in his benevolent work of seeing that every little boy and girl in the land shall find big, firm golden oranges in the toes of their Christmas stockings, was my companion on the hunt. It is Mr. Collier's relaxation to hunt the quail after the rush of fruit to the Eastern holiday markets; and a day afield with Collier means a limit bag, for he is an indefatigable hunter, and he knows where the quail are plentiful.

We had flushed a covey of about 300 quail—no, that is not a misprint, Mr. Collier conservatively estimated them at that, though I was positive there were nearer a thousand. After seeing that the little setter Keno was comfortably settled in the buggy, Collier joined me, explaining that no dog could work in that cactus, and that we didn't want to shoot at the birds in there anyway, only to frighten and scatter them into the hills. We hustled the blue runners pretty hard, and soon had them scattering. Finally 75 or a hundred quail in a bunch flew to the hillside, and we quit the dry wash and went after them. We found excellent sport, as they soon squatted and got up singly and in pairs and threes, about the right distance for some rare shots and some marvelous misses. These quail had a way of getting up in rocket flight on the side of a hill and dropping suddenly out of danger just beyond the rocks on the top of the ridge. I had succeeded in stopping some of the gamy birds beautifully just at the skyline, and then I began to miss them with monotonous regularity.

Mr. Collier came up the hill at this time and, with rare goodness of heart, consented to walk along the top while I worked out the side of the ridge. I was to take the straightaway shots and Mr. Collier promised to stop all those that came over the hill. He filled his part of the bargain and stopped all the birds he hit. The arrangement worked very well—for Collier. The birds all went over the hill, and to my shout of "Bird!" my companion responded with one barrel and sometimes two; and sometimes followed both shots by a word, which I shall not write here; and I took that as a sign that the strong fat man hadn't stopped that particular bird.

Some portions of the ridge were very rough and rocky, and I had to hang on with one hand and hold my gun up with the other and work my way along. It was in such places as this that the wise little birds flushed, and Collier got in his good work, and I may have said things.

We were on the southern side of the hill, the sun shone hot and the dust was rather unpleasant at times. Working along across a ledge I found myself in a position where I could only get around slowly and with considerable difficulty. Collier was waiting for me to come around, and I think he was thirty or forty feet above me.

At a point where there was a shelf of the ledge about level with my head, I had to reach up to a projecting rock on the rough wall of a small cavern-like opening in the rocks. Grasping the hold with my left hand, I drew myself upward and, with my gun held in my right hand, was in the act of swinging around the face of the short cliff, when I heard a sound instantly recognized, though I had not heard a rattlesnake's alarm for many years. It did not sound loud, but Collier heard it from his position above me. My bared forearm was within two inches of the rattles, which were vibrating nervously, and my face was within eight inches of the glittering eyes of the largest rattlesnake I had ever seen. He was coiled in his characteristic attitude, had heard me coming, but hadn't struck at my hand, which had passed over and within an inch of my head.

As I stood so near, my forehead, eyes or the spot where the temporal artery goes in through the skull to the brain, would have been a ridiculously easy target for the coiled and threatening rattler. I don't know how long I stood there, but it could have been but an instant, for in a flash I understood my danger. I simply let go all holds and dropped backward down the cliff. I believe I should have done this had the step meant a thousand feet. That death would have been no surer than to have remained. Luckily I landed six or seven feet below and experienced nothing more

than a jar, unnoticed at the time. Mr. Collier laid down his gun and started down toward me; his face was ashen and he was unable to speak. I understood the anxiety and sympathy his face expressed, and hastened to reassure him that the fall had not hurt me in the least.

"But the rattler," he shouted, "Didn't he strike you?"

He repeated the question several times and seemed unable to realize that I had escaped.

We worked around to the other side of the projecting rocks, and when we had gotten down on a level with the ledge we again saw the snake. He had heard us and was once more coiling himself in a defensive position.

"There he is," said Collier in a voice of suppressed excitement. "Now do things to him."

When he saw my reluctance to "do things" he raised his gun and took a cool, steady aim.

"I'm not going to let that serpent escape," said Mr. Collier, still holding his sighting eye on the spot. "Why don't you want to shoot him?"

But I could not explain why, and after a minute more insistence, my companion fired.

Now comes the part of the whole action that has since recurred in my dreams. It had a horrible fascination, and the scene comes back to me now vividly.

With the report of the gun the rattlesnake attempted to strike. He opened wide his great jaws and launched his horrid head toward us. I saw the light-colored interior of his mouth, and imagined, at least, that I saw the great curved and erect fangs. Again he struck blindly in our direction; but as the body was torn to a narrow shred ten or twelve inches back of the head, the snake was unable to leave his position. Then suddenly he turned, and with bared fangs and widely distended jaws, struck his own coils. Three times he repeated this, but did not seem to have sufficient power to penetrate the skin, though I am by no means certain of this, for, when Collier took a stick and went over to straighten out the body the snake struck the stick with such force as to hang to the stick with his long fangs.

Under other circumstances I should have taken careful note of measurements; but I didn't care to go any nearer than where I stood. Mr. Collier cut off the rattles and brought them to me. He counted eighteen rattles and a button. The end of the rattles, where they should have tapered, was as broad as the rest of them, and Collier expressed the belief that several rattles had been broken off.

Some of the impressions which I received at the time the snake was coiled were afterward amusing to me. For instance, I recalled Ransacker's skinned snake, and thought that if he should try to coil this one in his frying pan he would have to have a skillet as large as a wagon wheel.

Then I thought of Coahoma, and wished he might have had this handsome specimen in his collection down in Mississippi, among those which were at that moment waiting for the weather to get cold enough to benumb them so that they might be decapitated. Somehow I had never felt easy about Coahoma and Tripod until I read of the final beheading of those unhappy ophidians.

This Southern California rattler was a brownish-red and I had never seen a rattlesnake of anything but a harsh gray color. Then, too, this chap's head was round, broad and blunt at the nose.

This was unquestionably my narrowest escape, for neither the copperhead nor the moccasin could have inflicted a wound which would have been so sure and swift of fatal result as a strike from this brown-red monster of the cactus land.

While I was making ready for a trout fishing trip last spring, I prepared a small pocket outfit, which I have carried afield since then, and it has been a source of comfort to myself and to my hunting and fishing companion, who has accompanied me. I have a small case containing a hypodermic syringe and extra needle and two tubes. One tube contains small tablets of permanganate of potassium, the other contains tablets of digitalis. The latter I should probably not use unless at some time it might be necessary to keep up failing heart action. Then I have a small phial containing a solution of permanganate of potassium 1 to 100. I had the druggist prepare the solution because, in this country water might not be available at the time of an emergency. This case I invariably carry in the pocket of my shooting coat.

I still wonder why that rattlesnake did not strike. He had his finger on the hair trigger and could have pulled readily enough.

About the Quail.

The birds are still there, and after Kriskingle Kollier gets all the world supplied with refrigerated oranges, if he says the word, I shall join him, and we will go back down there—I'm not saying just where.

Difficult Pictures to Take.

It looks simple enough to get a satisfactory picture of a dog standing birds, and so it is, provided the birds lie close, as is generally the case with quail or woodcock, and the dog is staunch. But when the birds are partridges and the time late November, it is a different proposition altogether.

By that time it is pretty safe to say there are few partridges in Sullivan county, New York, where the accompanying pictures were taken, that have not been trailed by a dog, shot at or in some manner smelled the smoke of battle. They are always ready to run or fly from the slightest noise behind them, especially to run if the cover is at all open. One of the first things a mother partridge teaches her young brood is never to fly from an open space when man or dog is near; run to cover, and when you do fly keep behind a bush or tree.

Your dog may be holding a beautiful point, seemingly as rigid as the trunk of that big oak near him, and if you could walk on air it would be an easy matter to get an unobstructed view for your camera at the proper distance. But you walk through dry leaves,

the birds without ever thinking of the camera. Then I hid the gun in the bushes and followed Clem into a little swale, but the bird jumped before I was ready. Clem seemed rather surprised at not hearing the report of the gun, and no doubt the bird was also somewhat mystified about the man who hunted partridges with a black box that neither made a noise nor spit the little death berries after him.

On the outside of this swale Clem made a point that would convince you a dog really thinks. Those who have hunted him call it Clem's "fake" stand, a trick he always resorted to when you wanted him to hunt in a different direction from the one he evidently thought best. On such occasions he would pretend to be trailing a bird, and every few feet come to a point, but as soon as he saw that he had coaxed you into going his way he would break into his long, swinging trot and get down to legitimate hunting, evidently chuckling to himself over having worked that old trick once more.

Across the road, in an old field rather thickly covered with a miscellaneous growth of bushes and young trees, Clem made several good points. Here I fully realized the difficulty of getting the picture I wanted, and the perversity of a partridge, coupled with

It was Christmas eve, as on the previous occasion, when we introduced these three worthies to the reader. They had dined sumptuously as usual, and Tim had stepped out after dinner "to see what the night was doin'," in his own phrase, which led to the above little rumpus.

As soon as Jake had passed around the hot rum, steaming aromatically, Tim settled back in his chair and seemed to listen with a keen and almost poetic enjoyment to the eerie sounds of the storm out of doors. After a while he put his hand in his pocket and took out a meerschaum pipe, elaborately carved with a deer's head. This he filled deliberately and lit, while Jake and Wirt kept their eyes fixed upon him. Never, except on "state occasions," as he called them, did Tim smoke this pipe.

"Where did you git dot pipe, anyvays, Tim?" Jake inquired at length.

"That's a question you've asked every Christmas eve for nearly tin years," answered Tim, "and I haven't answered it for good and sufficient raisons, no offence mint. But I think I can answer it now, without injury to me conscience or anybody's reputation, as you'll understand whin I'm done."

CLEM'S "FAKE" STAND. NO SIGN OF A BIRD. JUST COAXING YOU TO FOLLOW.

CLEM POINTING PARTRIDGES IN OLD FIELD.

step upon fallen branches of trees or brush against rustling bushes—all of them good friends to the bird—and each sends its wireless message to an ear almost as sensitive as a Marconi receiver. Then the bird moves, the dog takes a step or two, and when he points again all you can see of him is what some tree or bush fails to cover. But don't give in that you are beaten; try again, and the next time you may get your picture. Again, you may come upon your dog pointing in just the spot you desire, with the bird within a few feet of his nose, and make your exposure without trouble. This chance generally presents itself when you have left your camera at home.

For this branch of the sport the dog should preferably be white, marked with lemon, brown or black, and not more than three or four years old. If he is an old dog and has been hunted a great deal, he is apt to become *blasé*, and will not give you the graceful point of a younger dog, whose blood tingles with excitement when he gets his nose anywhere near a game bird.

The dog used in obtaining these pictures was an unusually large, white English setter, with lemon markings, and belonged to Mr. W. H. Hankins, of Sullivan county. His name is Clem, and he is about six or seven years of age. He has probably been shot over nearly every day in the open season since he was old enough to hunt, besides doing a little summer rabbit hunting for his individual pleasure and gratification, of which sport he was very fond, as are most bird dogs. Indeed, when Clem appeared all fagged out at the end of a day's hunt, the sight of a pile of brush or a thick patch of briars that might be hiding a rabbit, would always brace him up. If he was fortunate enough to find bunny at home, you would see a chase when Long Ears broke cover that would astonish you. "How in the world," you would mutter to yourself, "could that half dead dog come to life so quick?" Clem knew such conduct was tabooed when out after partridges, and if you were nearby he would back away from the rabbit when ordered to do so, but before leaving always gave the brush heap a parting slap with his foot, just to see the little fellow run.

The first stand Clem made the day I had him out was in the edge of the woods by the side of a brook, the water almost touching his foot as it rippled over the stones. What a picture that would have made. And right here I discovered that I should have left my gun at home, for I stepped up and took a shot at

his fixed determination to do the wrong thing at the right time. Clem was not long in locating the birds, coming to a beautiful stand, one foot up and head and tail straightened out, but as I would move up to get the proper distance, the bird would run a few steps, until it seemed like a game of chess, except that the bird made his move almost simultaneously with mine and succeeded in checkmating me at every turn. At last he flew without leaving his image on the sensitive film waiting to receive it.

In a few minutes Clem again pointed, and this time I was fortunate enough to be at the proper distance, and snapped him just as the birds, three of them, jumped from under a cluster of laurels about twenty or thirty feet from the dog.

PRES. HALL.

How Tim Mulcahy Got Shot at for a Deer.

BY FRANCIS MOONAN.

THE door was flung open and the frosty air, accompanied by the driving snow, rushed in in a way to chill the whole barroom. Jake Kümmelwasser roused himself from an after-dinner nap by the stove and roared:

"Shut dot door!"

Wirt Zänder, who had been dreaming with his eyes open, while munching mechanically his beloved weed, looked around reproachfully and drew nearer to the stove.

"What's the matter?" cried Tim Mulcahy, who walked in and began shaking the snow from his clothing. "One would think that you two was a pair of hot-house plants!"

"Bah!" cried Jake. "You Irishmans vant everyt'ing vide open!"

"And you Dutchmin," said Tim, "only want your mouths wide open!"

In a contest of this kind Jake generally came off second best, so he made no attempt at retort, but merely requested Tim to stop his foolishness, shut the door and sit down.

"Bedad," said Tim, when he'd taken his seat, "This night reminds me of the night I slep' with the bear on the mountain."

Jake knew what this meant, and immediately proceeded behind the bar and took down the bottle of rum.

He took the pipe out of his mouth, regarded it contemplatively for a few minutes, restored it and then, between puffs, delivered himself as follows:

"It is nearly tin years since I was sittin' one evenin' in the barroom down at the hotel. The thrain had just come in, and as I looked out of the window I seen a young man with a shootin' kit get out of the stage and inter the hotel. I says to meself: 'Here's a chance of a job,' and I asked Gus, the bartender, to put in a good word for me if the stranger should be lookin' for a guide. Well, I hung around till after supper, whin I was pleased to see me man inter the barroom. He was a dapper little chap, dressed like a cock pheasant and talked with a drawl.

"'A—good evenin'," says he to Gus, 'let me have a brandy and soda.'

"Thiin he began to talk about shootin', and told Gus how he'd stopped off on his way to Pittsburg for a day in the woods.

"'You'll want a guide, of coorse,' says Gus.

"'Well—a,' says he, 'that depinds. They're such frauds, most of 'em, dontcher know.'

"'Oh, I don't know,' says Gus. 'I guess some of them are all right. And there's one of 'em here now.'

"'A—is this the man?' says me lord, turnin' to me. 'Are you a guide?'

"'Well,' says I, 'I have done some guidin' in me time.'

"'Do you think—a,' says he, 'you could find any deer in the woods?'

"'I think I could,' says I.

"'A—,' says he, 'that's what ye all say!'

"'You think,' says I, 'that we're inclined to be too oppymistic?'

"'That's the poloite way of puttin' it,' says he, 'but I think worse than that.'

"'You don't seem to think much of us,' says I.

"'Well—a,' says he, 'I'm afraid not.'

"'That's too bad,' says I. 'Thin if I war you I'd go it alone.'

"'I think I will,' says he, 'and—a—I fawncy me chance of a buck will be none the less.'

"'All right, me buck!' says I, 'no harm done.'

"'You're a very impertinent man,' says he.

"'You bet,' says I. 'That's me.'

"He flung out of the barroom in a huff, and Gus and I fell a laughin'.

"But I stopped meself suddinly and says to Gus:

"Gus," says I, "I'm goin' into the woods to see the fun, but I ain't goin' to take any chances. Will you lind me one of your han'kerchiefs?" says I. "What for?" says he. "Never mind," says I, "but get it." He got it and thin I spread it out on the bar and had Gus to paint on it in bould charackters with a piece of a stick and black ink:

DON'T SHOOT,
I'M A MAN.

"Gus," says I, "I'm goin' to hoist that on me rifle and carry it like a flag at the head of a regimint."

"Well, I was up bright and early the next mornin' reconnoitrin' the hotel, and seen me gallant sport march off alone with his brand new rifle and his brand new shootin' suit. I started after him whin I seen him inter the woods. I felt purty sure that he'd keep to the beaten thrail up the mountain, and thin down to the valley beyant, but I was mistaken, for whin I intered the woods after him and made a spurt to get well up in his rear, I couldn't get a sight or hear a sound of him. Howsomever, I kept on to the valley, hopin' he might make his way there somehow. It was my idea that if I ran into him he'd be so disgusted with his luck that he'd employ me there and thin—but I was detarmined to make him apologize first for his words of the night before. Well, I poked about all day, but never once got wind of him. 'Mebbe,' says I, 'the poor child's tired out and gone to sleep somewhere.' As evenin' came on I began to feel a bit tired meself, as I always do whin I have no excitement, so I thought I'd rest a while and have a pull at the pipe before startin' for home.

"I sat down on a rock behind a strip of bushes, takin' the precaution to plant me flag alongside of me. It was a beautiful evenin', fine and mild, with the settin' sun gildin' the brown laves of the forest. I was smokin' away, continted enough in spite of me disappointed, whin I heard somethin' crack. I turned me head to listen, and the next minute bang! wint a rifle, and the pipe was knocked out of me mouth. Aha! thinks I, I'm up agin it, after all. I threw myself flat on me face and awaited devilepments. In a minute or two somebody comes runnin' up, and then I heard the voice of me new acquaintance:

"My God! he cried, 'it's a man!'

"Thin he took to sobbin' like, and—I first lost meself," says he, "and now I've shot a man. Oh, miserable wretch! What'll become of me?"

"I remained stock still, and again I heard him break out: 'He's dead—stone dead. No use stayin' here. Let me save meself.'

"With that he turned and fled. I jumped up at once and made after him at a distance.

"I'll tache this woodsman a lesson," says I.

"He kept to the valley, but didn't seem to know where he was goin', only dashin' along whatever way was clearest. In a little while it began to grow dark, and thin, as I seen him stop to take breath, I gave a long wailin' cry, as of a man in distress. He looked about him like a frightened deer, and thin took to his heels agin.

"After a while he came to a clearin'. The moon was risin' and everything looked dim and ha'nted-like. Thin I began dodgin' about the clearin', utterin' moans and groans, with an occas'nal wailin' cry like the first one. There's an echo 'way back in the valley, and it took up the sounds of me voice and made such a horrible din that bedad I was almost frightened meself. As for the poor chap in the middle of the clearin', he seemed paralyzed with fear. At length he threw himself down on his knees and covered his face with his hands. 'I took pity on him, and comin' out of the woods began to hello to him. He looked up and seen me, and thin he jumped to his feet and was away as if he'd seen the divil.

"Stop! I cried, 'or I'll shoot.'

"You see I wanted to get him home, for I was afraid if he spint the night in the woods he might expire from sheer fright. But he didn't heed me, but dashed on and disappeared in the woods. I followed him for a while, but he was too nimble for me—and to be sure the fear in his heart put wings on his feet—so I gave up the chase and made for home.

"In troth, I felt sorry for the poor tinderfoot, though he'd nearly done for me, and prayed that the Lord might spare him through the night. I rached home very sad and anxious—I was thin boordin' at the Widow Casey's—and didn't spake a word to a sowl, but wint straight to bed. I couldn't sleep a wink from thinkin' of the poor wanderer in the woods, and blamed meself contin'ally for playin' such a trick on him. Howsomever, I was up long before dawn, and stuffin' a few provisions and a flask of whiskey in me pocket, made off on a search expedition.

"It was just breakin' day as I rached the clearin'. I looked about, and the ground bein' soft after rain

had no trouble in findin' the thrail. I pursued it for a considerable distance, thin lost it on a ledge of rocks. I looked around the ledge, but couldn't find the sign of a footstep. I was puzzled. Some trees grew close to the ledge, and I thought he might have sprung into one of thim to hide, so I looked through thim, but to no purpose. 'Whatever could have become of him?' says I, sorely puzzled. While I was debatin' the question I heard a groan. It seemed to come out of the ground. I looked around more attintively than I had before and seen a clift in the ledge. 'Ah, ha!' says I, and up I wint and there found the poor little dude sport lyin' on his face between the rocks. Ividently in his wild flight he'd stumbled and fell in. I got down beside him and shook him.

"Me poor lad," says I, "this is too bad. How do you feel? Are you hurt?"

"He gave another groan, but didn't answer. I took him in me arms and carried him over to a grassy spot and sat him down with his back to a tree. He hung his head on his chest and seemed to be in a sort of thrance. I forced some whiskey down his throat and rubbed his hands and timpls. Prisently he lifted his head and looked at me.

"I've shot a man," says he, then hung his head agin.

"Come—come," says I, "you mustn't give way like that. Brace up and be a man."

"I put the bottle in his mouth agin and made him take a good swig. It put more life into him, and in a little while he got up. Thin lookin' at me, he repeated:

"I've shot a man."

"Are you sure?" says I.

"Yis," says he. "I seen him dead—stone dead. And I heard him."

"Heard him?" says I.

"Yis—heard his ghost," says he, trimblin'.

"The Lord save us!" says I. "But why did you shoot him?"

"I took him for a deer," says he. "I seen something white and I thought it was the deer's flag."

"Oh, tear an' ages," says I, "this beats all," and took to laughin', so that I had to hold me sides.

"What are you laughin' at?" says he.

"I'm laughin' at your simplicity and me own," says I. "Do you see that flag?" and I pulled Gus's han'kerchief out of me pocket.

"He nodded.

"Well," says I, "this is the flag you shot at—and this is the man. And if you didn't shoot me it wasn't because I didn't deserve to be shot, for carryin' such a thing as that into the woods."

"His face, which was pale as death before, flushed up with the joy in him.

"Oh, tell me," says he, "that you ain't foolin' me—that you're in earnest?"

"Sure, I'm in earnest," says I. "Here's me hand on it."

"But how about those awful cries?" says he.

"Oh," says I, "that was a little joke of mine to scare you."

"Ain't you the man I met in the barroom of the hotel last night?" says he, lookin' at me attintively.

"The very same," says I.

"Well," says he, "I apologize for what I said to you. I was a fool to spake as I did of guides."

"Mebbe," says I, "you spoke of thim as you found thim. But they ain't all the same."

"That's true," says he, "for you're a divilish decent, clever fellow, and I'm your friend for life," says he, stretchin' out his hand. "My name is Percy Van Coortlandt Brown, and you must let me reward you for what you've done for me."

"My name is Timothy Mulcahy, sir, at your service," says I, "but I don't want a cint for what I've done. I had the value of me money out of you last night. But," says I, thinkin', "I have a poor old mother in Ireland, and if you have a mind to be ginerous—"

"Let me have her address," says he.

"He took it down, and thin says: 'But really you must let me sind you something, if only for a soovy-neer.'

"Well, if I must," says I, "let it be a pipe, for whin you fired that shot yisterday, bedad you knocked me old doodeen out of me mouth. And I must compliment you on your aim," says I.

"Mulcahy," says he, "you're the right sort. You shall have the finest pipe that money can buy. And I'm comin' back here next year for a whole week's shootin' with you. In the meantime, say nothin' about what has happened."

"I'll never spake of it while you're alive," says I.

"And neither did I, but—" and here Tim lowered his voice—"I happened to read in a New York paper the other day that poor Percy Van Coortlandt Brown was no more. And will you believe, gintlemin, how he came by his untimely death? He was shot in the woods!

"Sure there must have been a fate in it," concluded Tim. "But, anyhow, it would be a grand thing if fire arms could be kept out of the hands of fools."

Killdeer Plover.

Of all North American shore birds, perhaps none is so well known as the killdeer plover. Though not often seen in these days on the New England and north Atlantic coast, it is abundant in the interior, north and south, and though not found in great companies, like other plover, and most beach birds, its distribution is very general. Besides, its appearance is so striking, and its voice so shrill and so constantly in use, that

TWO SNAPS AT A KILLDEER—ONE.

it draws to itself the notice of every one who invades the territory which it inhabits. This shrill and characteristic cry has given it its vernacular name, as well as the specific name, *vociferus*. If alarmed by man, and especially if its breeding grounds are approached, the killdeer at once remonstrates by its shrill whistle, and not one bird only, but perhaps a dozen, if so many are in the neighborhood, gather about the intruder, and flying near him seem to urge him by cries, threat-

TWO SNAPS AT A KILLDEER—TWO.

ening or imploring, to take himself off and let them alone. It is not by day only that the killdeer is heard. Often his remonstrant whistle comes to the ear of him who travels by night, and to judge from the way in which it circles about, or passes over him, its actions in darkness are much the same as during the day.

Although one of our shore birds, the killdeer hardly merits the name of a game bird. It is neither especially good to eat nor good to kill, and there is neither pleasure nor credit to be had from its pursuit. Audubon says that in early autumn the birds of this species are fat, juicy, and tender; but he adds that at all seasons of the year the killdeer is shot by inexperienced sportsmen. The pursuit of this innocent bird cannot be recommended.

The illustrations here given were taken as snapshots not long ago in Mexico, and show how tame the birds are there. The picture of the one which is running is extremely interesting.

The Steam Yacht Noma.

NOMA was built for Mr. William B. Leeds from designs by Messrs. Tams, Lemoine & Crane, of New York City, who also supervised her construction, and delivered her to Mr. Leeds complete, ready for sea, in March, 1903.

She was built by the Burlee Dry Dock Co., of Staten Island, under the special inspection for highest classification in the American Bureau of Shipping.

Noma is the largest recent addition to the New York Y. C. fleet. She comprises many novelties in equipment and design which make her of more than general interest to the steam yachtsmen of America. Her great speed, the comfort and amplitude of her arrangements, the completeness of her equipment and the smoothness with which she runs, even at the highest speed, have appealed to all who have seen her. Her dimensions are as follows: Length over all, 252ft.; length waterline, 226ft.; breadth, 28ft. 6in.; draft, 14ft.

Needless to say, her hull is of steel, and she has a steel deck; in fact, wherever strength is necessary steel has been used; even the deckhouse of polished teak though it looks, is built of steel throughout and merely clothed with teak, as the modern office building is built of steel and clothed with brick or stone.

For greater safety, she has been fitted with seven watertight bulkheads, and three of these, through which doors are cut, are fitted with the Long-Arm System Company's system of watertight doors, with a controller on the bridge, so that in case of an emer-

gency the captain can close all the doors immediately on the ship. One of the most interesting features of the doors is that after they have been closed by the captain they can be opened to allow a man to get through and out of danger by pressing a handle, and the moment the handle is released the door closes again automatically.

The machinery, which is to a steam yacht what sails are to a schooner, would prove of the greatest interest to any engineer. A few general figures should interest even the sailor. In Noma's engine there 37 different steam cylinders, which drive 22 independent engines. These engines vary in size from the large propelling engines of 2,000 horse-power each to the little pump of 2 horse-power, which keeps the fresh water and plumbing tank filled. Steam is furnished by 6 Almy water-tube boilers. When the yacht is going at full speed these boilers burn 8 tons of coal an hour, and are fed with 5,000 cubic feet capacity of air from 3 sets of steam-driven fans. The use of the bulk of this machinery is, of course, for moving the vessel, but in addition to these machines for moving, there are an ice-making and refrigerating machine, fire and plumbing pumps, dynamos and ventilating fans, whose main use is to increase the comfort of living.

The contract called for 16 knots under natural draft, and 14 under forced draft; but on trial in regular service she has largely exceeded these speeds. On trial she made 19.06 knots between Sandy Hook Lightship and Fire Island Lightship, a distance of 29¾ nautical

miles, and in the race for the Lysistrata Cup, July 24 last, against the Kanawha, she slightly exceeded this speed over a course of 60 nautical miles.

One of the most notable features of Noma at high speed is the entire freedom from vibration. This smoothness of running has been especially remarked by all who have been on board.

She has a bunker capacity for 240 tons of coal, and carries 13,000 gallons of water in her tanks, in addition to which she has an evaporator of 2,000 gallons daily capacity, and a distiller capable of making 500 gallons a day of drinking water.

The electric outfit is most complete, consisting of two large generators, large storage batteries, electric windlass (the motor which drives this electric windlass is the exact duplicate of one of our usual street car motors, which will give one a good idea of the power required to hoist and break out one of Noma's anchors, which weigh a ton apiece), two electric boat hoists and one electric fan for ventilating system, in addition to such minor luxuries as electric curling-iron heaters, cigar lighters, searchlights, decorating lights, etc.

Noma's ventilation has been most carefully studied. In addition to individual skylights for every room, there is an exhaust fan situated in the fiddley, which sucks air through the air ducts leading from each state room. This exhaust fan is large enough to cause a 10-minute change of air through the whole of the owner's quarters. The running lights, also range,

stern and anchor lights, are electric. Connected with the running lights is an indicator on the bridge which automatically shows whether they are in order, and shows when any light is out.

The log has electric connection with the bridge to an indicator, so that the rate and distance run can be seen by the officer on duty at a glance. She has on the bridge an automatic fog controller and recorder, by which the whistle can be set to blow automatically at any time, and the time and duration of the blasts are recorded in the chart room, so that any question arising from collision or otherwise, there is definite record instead of relying on the testimony of more or less excited beings.

The yacht has a refrigerating system consisting of a Brown-Cochran carbonic acid gas machine, which keeps the main cold storage room, butter, milk and egg room, and pantry and galley refrigerators at their proper temperatures. Its capacity for ice-making is 500 pounds per day, in addition to doing all this refrigerating work, and is further of a size which allows of the machine being shut down at night for at least 10 hours. There is also a separate ice box for preserving fish.

The plumbing conditions vary little in appearance and working from that in a modern first class house. There is running hot and cold fresh water. The old-fashioned pump watercloset has been abandoned, and new siphon closets installed. All bath rooms have tiled floors and tiled walls, and are fitted with porcelain tubs and porcelain lavatories.

Noma carries six boats; namely, a 10 horse-power naphtha launch, non-capsizable, self-righting lifeboat, a one-rater sailboat, ship's sailing cutter, ship's dinghy and a steward's launch.

Every room in the ship, including officers' and seamen's quarters, has independent and separate air and light.

The deckhouses, skylights, bulwarks, rails, etc., are of teak, framing of deckhouses being of galvanized steel.

The keynote of the arrangement of the owner's quarters has been comfort and amplitude—rooms, passages, stairways, all are large and commodious. Everywhere the usual cramped feeling of a ship has been avoided. The headroom is ample, not only below but in the deckhouses. In the general scheme of the arrangement the living rooms are in the deckhouses on the main and shade deck, and consist of owner's office and suite, dining room, smoking room, music room and chart room. On the cabin sole deck are situated the state rooms, bath rooms, etc., with the owner's own quarters forward, the owner's and bachelor's quarters aft, where, also, is the library.

The principal rooms were designed by Messrs. Hunt & Hunt, architects. Their scheme in general was to find effect with simplicity, proper scale, and what might be termed "nautical interest in detail."

The success of their treatment is marked and original, and has been admired by all who have seen Noma.

Below decks, where the rooms are lit by portholes, the library and all the state rooms are carried out in rubbed white enamel paint in order to have as much light and brightness as possible.

The color scheme of the library is green and white,

and set in the mantel over the fireplace is a large and very fine water color by H. Reuterdaahl, which represents the battle of Portland, Feb. 28, 1653, one of the most important naval battles of the Anglo-Dutch war.

The wall panels of the owner's stateroom are covered with a material the color of bride roses, with silver gray and green in the upholstery and carpet. Over the bureau, either side of the beds, are large mirrors. There is a shell molding around the panels, and the furniture is mahogany.

The dining room on the deck above is Dutch in feeling. The facing of the fireplace is dark blue and white tiles, the tiles representing different scenes of the sea. The corbels of carved wood represent sea pirates. The electric light fixtures, which are on the stiles between

the windows and on the ceiling, represent pirates' heads. The room and furniture are oak. The coloring of curtains and carpet, dark blue; of the metal work, silver.

The smoking room, although one of the simplest rooms, is very effective. Its walls are sheathed in teak with dove-tailed wedges at intervals on the vertical joints. The upholstery is of leather, the curtains cloth.

The owner's deck state room and the owner's sitting room are mahogany with blue coloring in the materials.

On the upper deck the chart room is paneled teak, and the upper deck sitting room, which might also be called the music room, as framed in one end of the room, there is an orchestration, is finished in enamel paint of an ivory tone. The ornamentation over the

windows and orchestration is composed of representations of nautical objects, such as shells, sea weed, etc. The materials are light blue and the electric fixtures represent turtles, which clasp the necking of the capitals and hold the electric lights, which illumine the room through the amber-colored glass backs and give a charming diffused light.

The vestibules on the main deck are treated in natural teak, and are very effective with their paneled walls and interesting stair railing, made of a series of wood panels with boats carved in relief. Between the panels are coupled posts, between the posts shells and sea horses, and forming part of the base course is a molding composed of a succession of sea shells, the newel posts represent dolphins.

National Gun Clubs.

WITHIN the last two or more decades several eminent trapshooters, earnest in their purpose to promote the general good of trapshooting as a gentleman's sport exclusively, have made attempts to organize and establish a national trapshooting body, clothed with full representative powers of guardianship against abuses, and with full governmental powers over all local clubs throughout the United States. This consummation is still the ideal trapshooting dream of many good and wise sportsmen. However, all the attempts of the past have been futile.

As a theoretical proposition, a national trapshooting body, with beneficent governmental powers, seems to be both reasonable and feasible. All the superficial conditions seem to favor the idea. As a constituent support, there are hundreds upon hundreds of gun clubs, and thousands on thousands of shooters, to be found everywhere throughout the United States. The town which has not, or which has not had, a gun club is a dormant town indeed. With all this active material, a national controlling body would seem to be past the stage of the speculative; it would seem to be in the realm of the essentially necessary. And yet there must have been some unfavorable, inherent causes antagonistic to the formation of a national body, else the failures of the past, in the attempts to organize, would not have been so uniformly futile.

In comparison with other forms of sport which have central governing bodies, trapshooting interests, from their apparent magnitude, importance and class of patronage, would, theoretically, seem to require a similar organization.

In this connection we observe on analysis that the forms of sport which have powerful national organization, on the one hand, to safeguard their interests from injury by the predatory or the dishonest, and, on the other hand, to formulate and enforce rules of action which steadfastly promote the best good of all concerned, have component parts entirely different from the corresponding component parts in the world of trapshooting. These component units are uncompromisingly unlike. On examination the fact becomes quickly and clearly established that, aside from by actuating impulse, the fondness for sport, there is no analogy.

By way of illustration, let us consider the units, the clubs, which make the confederation known as the National Trotting Association, in so far as they relate to this subject. The unit, the club, is a thoroughly organized body in itself. It has permanency. It is a constant. It has important business interests and relations. It possesses property in value from thousands to hundreds of thousands of dollars. It has a secretary and other officers, who respectively are paid salaries, and who, therefore, are required to be officially competent and industrious as a matter of bounden duty. These officers, consequently, do not act from whimsical impulse, or from the courtesy of good fellowship, as do men who act from a fondness for sport, or who act without remuneration. Moreover, the trotting club receives large revenues from the gate, the bar and the book privileges, and in every particular, has all essential to an active, valuable, permanent business institution. Also, the Association governs with the consent of the governed.

Here, at every point, in the consideration of the clubs as units, we observe that there are vast property and business interests, skillful organization from base to pinnacle, active salaried officials, permanency and responsibility.

Athletic associations also have valuable properties and interests as a rule. Their activities are so closely associated and interdependent, and they have such a common interest in maintaining a strict integrity in the sport owing to the immense sums involved, the prestige of the associations which are interested, the requirements of sportsmanship and the requirements of public opinion, that concerning them a confederation for the general good is imperative.

Let us now relatively consider the club units existing in the trapshooting world, as they are or are not available as component parts for the formation of a national association.

We observe that there are permanent gun clubs with some property interests, but their number is not large. The average gun club as a rule is entirely local in its zone of influence; and, if it have any property at all, the value of it rarely exceeds a few

hundred dollars. The officers as a rule perform the duties of their offices without any monetary remuneration whatever. These duties, however, are so light that they are not unduly burdensome. Most of the official work is in connection with the weekly afternoon shoots, beginning and ending with them. Indeed, sometimes it is a member, not an officer, who is the enthusiastic leader and hard worker. In most instances, when the one or two workers quit, the club quits also.

Commonly, the gun club is a group of friends, without any serious form of organization. The motive is social and competitive, and chiefly concerns themselves. The rest of the world may have, to them, merely an incidental consideration. If once the members lose interest, the property values are too insignificant to hold the organization together.

As a unit of a national organization, the average gun club is too ephemeral. The club unit, to be of value, must, to a reasonable degree, be a constant.

But, assuming for the sake of the discussion that the average gun club is permanent, then, as a possible unit of a national association, it would need some materially advantageous inducement to cause it to seek membership. If it did not give any tournaments, a membership then would confer no benefits. If it did give tournaments, its revenues were limited to the receipts for the sale of targets; it has no gate receipts or other source of public revenue. As a rule, the contestants shoot for their own moneys. The little domestic affairs of the club are too insignificant and too local in character to require any attention from a national body. Moreover, the average club could not afford to pay the expenses of a delegate to a national session, and it could not afford to pay its quota toward paying the salaries of a national board of officers. Without such salaried officers, the national organization would not exist at all in reality. Without a material remuneration on the part of the officers there would not be any responsibility. It then would exist simply in idea.

But let us suppose that there is a national organization of clubs, and that there is a board of national officers elected. What interests have they to safeguard which warrants their official existence? What duties have they to perform?

There is not enough clashing of dates to require the existence of a national body.

The purses are not sufficient to require any national care.

The betting is not any feature of the competition as in horse racing, and therefore needs no legislative action.

There is not such a dearth of sportsmanship that a national body is necessary to promote it, and even if there were, how could a national body promote it one way or the other?

A national body would be limited in authority to the units which composed it.

Is a national body necessary to decide the question of amateur and professional? Every man who has shot to any extent in tournaments is now a professional. The status of manufacturers' agents and other shooters has been more or less definitely passed upon already, and accepted as a matter of usage.

Any self-elected body cannot have any representative powers. The mere claim of name having a national significance confers no national powers upon it. In a national sense, such club exists only in idea. It cannot declare any rule for others because it has no authority to do so. It can declare only for itself, and that any other club can do likewise.

A fair analysis shows that the need of a national trapshooting body, under existing conditions, is founded on matters sentimental instead of matters material. Each average shooter will admit the desirability of having a national body; but, feeling no personal need of it himself, he thinks that the other fellow should do all the material promotion in the matter. The other fellow, conversely, has the same feeling. Neither has more than a sentimental interest in the matter, and neither has club property enough to need any extraneous safeguards, or important business relations with other clubs or shooters, or revenues, to make possible a confederation of national scope.

As the trapshooting world is at present constituted, a national trapshooting organization now seems possible only in the realm of the imagination.

B. WATERS.

The Witchery of Blowland.

IN a far-away tropical island of the boundless seas, called Blowland, there dwelt a highly civilized people, who, two short centuries ago, were barbarians. This nation has ceased to exist. They as barbarians were rescued from their deplorable, savage state by virtue of the beneficent, arduous labors of two or three missionaries, supplemented by the good offices of several thousand sailors of the merchant marine and whalers. This number of sailors was not present on the island all at the same time. The crews of one, two or three vessels were there for a few days or weeks only, and as they went other crews came.

The sailors, in their philanthropic efforts to uplift and benefit the barbarians, wrought close to twenty-four hours each day. The missionaries talked at the savages; the sailors talked to them. In this effective manner, civilization quickly gained a permanent foothold. Indeed, progress was so rapid that it was fairly astonishing; inasmuch so that in a few years it was the proud boast of them as a people that it was a contest, nose and nose, between their vault and safe makers on the one hand and their safe crackers on the other, as to which of them were the more expert, and therefore which could claim meritorious ascendancy. However, with the aid of a high-salaried police force, supplemented with automatic burglar alarms, the safe makers held the advantage; thus, by not permitting the burglar to toy with them, the efficiency of the safes was maintained.

However, the rivalry between the safe makers and the safe crackers was only one form of the many competitions incident to the high state of civilization so quickly acquired by these savages.

The civilized savages had a belief that all work and no play make Jack a dull boy; therefore, they devoted a reasonable portion of time to play. Among themselves, they achieved great renown for their comprehensive and refined sportsmanship, and truly it was justly merited.

They had an inherent passion for sport—a passion so common and constant that it was not a whit less than national in its scope and importance. Different kinds of wholesome competition were adopted, and also were so fostered with a liberality of purse, of participation, and of enthusiasm, that their dignified, happy success, present and future, were assured beyond even a doubt.

Among all classes a perfect comity prevailed. The rich and the poor, the wise and the simple, the taught and the untaught, associated together on equal terms in all the different forms of contests. If there were any caste distinctions, they were treated as a mere idea; at least, during the competition, however much of a reality they became immediately afterward.

Among this highly civilized people, once savage, marksmanship was easily the most popular, the most general, and the most useful form of sport. In all matters of marksmanship, they placed firearms under a ban. Of the numerous kinds of weapons which they used, the blowgun was incomparably the favorite of the people, and might in all fairness be termed their national weapon. In its use they were admirably skillful. To such a degree of perfection had they attained with it that objects, when shot at, whether in motion or at rest, were alike hit with ease, certainty and precision.

As the reader may anticipate, it required good lungs to successfully compete and become a leader in the use of the blowgun. Nevertheless, even the weakest could blow hard on occasion, so that, as to ability, the marksmen might be classified as blowhards, blowharders and blowhardests. The blowhardests could betimes be heard in every nook and corner of Blowland, and to blow hard was, by some, considered an essential feature of the sport, if indeed, it was not the most meritorious of their performances.

In all that pertained to the theory of their sport, they were correspondingly learned. The knights of the blowgun had a profound code of rules and regulations which governed the competition equitably. Clubs throughout the country existed for a special purpose to maintain the sport. Mammoth factories were

114-116 Market Street, San Francisco.

constantly employed in the manufacture of blowguns and darts, bows and arrows, boomerangs, harpoons and fish-hooks; and, though their total output was enormous, it was much of the time less than the demand.

As easily may be conceded, this perfect development of sport and manufacture could not have been attained without a special literature devoted to it. It had that literature. It had quite an extensive literature devoted to every branch.

Some of the sportsmen's journals had been identified with the progress of the sport from its infancy, and they were most important factors in promoting its growth progressively and on correct lines as to methods, sound knowledge as to equipment, and true teachings as to ethics.

Thus, in the establishment of sport as an institution, three different branches were coincidentally established, each highly specialized, namely, sport as represented by clubs and individuals, by manufacturers, and by literature. Each was mutually advantageous to the other, and each reciprocally conferred benefits to the others.

Long ago, in Blowland, there was a year of national, impulsive enthusiasm in blowgun competition. The people at large were actuated by a desire to decide which were the best marksmen, and coincidentally who could blow longest and hardest. The old blowgun clubs were aroused to activity, and new blowgun clubs multiplied like mushrooms. There was competition throughout the land. Each club was eager to hold a tournament, or "game," as it was known to the sportsmen of Blowland, that term being peculiarly applicable to many of the competitions held in some sections.

The first "game" of that year was given in the springtime by a club whose secretary was energetic and of original ideas. He was an ardent admirer of sport and sportsmanship in the abstract and also in the concrete, when, under some hocus-pocus of competition, he could commit some other fellow to pay his expenses.

One morning, in his well-ventilated country apartment, after a profoundly thoughtful, sleepless night, he sat him down at his table and wrote 159 letters, as follows:

Wolf Cross Roads, Isle of Blowland, April 1, 1776.

Dear Sir—The Blowhard Blowgun Club, of this thriving city, has decided to give a "game" of marksmanship, and to that end claims the dates of May 1 to 10. The members of the club are all gentlemanly blowhards, as you know, and, moreover, they are a very dignified body of men, as shown by the policy presented in this letter. They are enthusiastic in promoting general skill in the use of the blowgun to the end that our beloved land may have a citizen soldiery ever ready to defend it against the invader, that better laws may be enacted for the preservation of our valuable game birds, and that there may be a general impetus given to the promotion of better acquaintance and good fellowship. We know that your esteemed firm is in deep sympathy with our club purposes, and frankly I will say that I think that the members of the Blowhard Blowgun Club deserve it. We first and last have done a lot for you. We have used your goods entirely for your sake, and not because they were of any use to us personally. I will see that your act is advertised in all sportsmen's journals. Every one of our members is a user of your ———, a fact which I submit for your careful consideration. I am sure you would not care to unpleasantly jar the deep, deep esteem they now have for you. I know of one member of our club who walked thirty miles over muddy roads, out of his way, to demonstrate the worth of your goods to a man who was actively unfriendly to them. Another member sat up all one night in a ceaseless effort to discover some new idea to present to the public in your favor. This is a fair sample of our unselfish loyalty to you. In view of all this, we are now anxious to have you donate something to add to our "game," and this we expect to accomplish through the medium of this letter. I have faith that you will send us an article of sterling worth; perhaps one of your very highest grade. I have great influence with the sportsmen's journals. I beg, my dear sir, to subscribe myself,

Yours, devotedly,
S. PUMPKIN VINE, Sec'y B. B. C.

"Heads, I win; tails, you lose," muttered Pumpkin.

Then he wrote a circular letter to each one of the sportsmen's journals, as follows:

Gentlemen:

The Blowhard Blowgun Club has claimed the dates May 1 to 10 for our tournament. Please publish that weekly in your column of fixtures. I enclose advance sheets of our "game" programme, which you no doubt will be glad to publish as a matter of news. Please publish in full. It will not take over a column of your space, and it is for the good of sport. We will have the

programme ready to mail in two weeks, when you might notice it again. I am very busy now, and wish that you would make up a note or two each week about this "game." It is going to be great. Cannot you give us an advertisement for our programme? It reaches a class who are deeply and passionately fond of literature, and a friendly word from us, if we happen to think of it again, would bring you a fortune. Our rates are: One page, \$25; one-half page, \$15; one-quarter page, \$10, strictly in advance. Please give us a subscription or two as a special prize. We hope that you will not fail to send a staff representative to our "game," otherwise we will feel unkindly toward you. Please put me on your complimentary list. I have a well-broken rabbit dog which I will sell cheap. If you know of any one who wants a first-rate puppy, mention me. What is the best cure for mange? I will expect your ad. I am a great admirer of your journal. Our club members are lovers of pure sport.

Yours devotedly,
S. PUMPKIN VINE, Sec'y B. B. C.

The recipients treated the circular communications with that calmness which comes from long habit in such matters.

In the blank space of the circular letters sent to the manufacturers, the secretary inserted the name of such articles as the addressee manufactured. The plea on which the letter was based was false in the main, or at least almost wholly imaginary. A few of the victims, however, responded favorably, some out of pure kindness, some out of a fear that rival manufacturers would respond favorably and thereby purchase the club's friendship away from them, and some again out of fear of a possible boycott. Therefore, on the day of the game there was a varied array of merchandise prizes, blowguns, shooting jackets, ammunition, cases of whisky and beer, field glasses, barrels of flour, coal, crockery ware, pictures, etc. The home merchants were pressed the hardest, and responded more uniformly, for they were more directly amenable to the force of a boycott, and of the persuasion of the blowhards.

The merchandise event, the prizes of which were all collected on the plea of furthering the sport, had a \$5 entrance fee, and as there were one hundred entries, the total receipts concerning it were \$500. And this money the club put into its treasury. The true status of the merchandise transaction was that it sold the merchandise for its own use, though it was secured and donated under the plea of sport for the multitude.

The success of the Blowhard Blowgun Club quickly spread abroad throughout the land, and nearly every other club in the land immediately adopted the same identical methods. The proposition, reduced to simple terms, was this: We are to hold a tournament; we ask you to donate some goods for the benefit of the sport, which is really for our treasury.

It so happened that in the summer of that year, an eminent blowgun manufacturer, Elijah Stubtwist; a foreign sporting editor, M. Quill, and S. Pumpkin Vine, met in Pekin. They, like all other men of large revenues, desired rest, comfort and change during the warm weather; therefore, they journeyed abroad. They greeted each other with pleasure, sought a nearby café, where they comfortably ensconced themselves about a table and each ordered a glass of ice water. After some talk of home, Stubtwist said:

"How did your 'game,' in foreign lands called a tournament, succeed, Mr. Vine?"

"I am sorry that I have to report that it was a failure, sir," replied Vine. "We lost quite a lot of money."

"Of course, of course," remarked Stubtwist, "that is to be expected at a merchandise shoot; everything donated. Well, anyway, I suppose that you and all the members of your club are using the Stubtwist gun, and are still sitting up nights thinking of its wonderful excellence. I have not noted the slightest advance in my trade in your section, nevertheless. But, tell me, Mr. Vine, why did you write to all my rival manufacturers about their guns in precisely the same tenor that you wrote to me about my gun? Were you really promoting sport, as you said you were, or were you grafting?"

"Why, er, er, those things are merely the accepted fictions of sport, and are commonly considered as being all right," replied Vine.

"All right by whom? Not by the donors, I am sure. Do you mean to tell me in all seriousness that you would perpetrate and maintain a fiction to secure a valuable gun or anything else?" and Stubtwist looked at Vine rather sharply.

"Certainly," replied Vine, with perfect composure. "They all do so when they can. As a custom, it does much in the good furtherance of sport, because it brings men into competitive action; it upholds an institution which consumes your goods, and it fosters friendly rivalries, which guarantee its perpetuation."

"But how does it help sport, if I give my goods to you? I already have all the cash orders I can supply. Suppose that I

gave a gun to every Tom, Dick and Harry who came along with a story similar to yours—how long would I have any business at all? It is true that I know you personally, but I do not know anything whatever to substantiate the claims which you made to me. I cannot perceive how it helped me in any way to give you a gun; but I think that I can perceive how it helped you quite a lot. You did not do a single one of the things that you promised to do for me, and in all probability you never intended to do so; nor had you the power to do so even had you wished. You assumed a power and importance that you did not possess. You had no more influence than any one else. There is, moreover, no reason on earth why your club or any other club should come to me either as oracles or mendicants. True sportsmanship is not based on pauperism, nor on methods of pauperism; nor is it dependent on chicanery for its best activities. A true sportsman is as scrupulously careful in matters of business as any other gentleman is. Indeed, he is too proud-spirited to accept a gratuity from any one, even if it is cloaked with all the forms of a commercial transaction. Let me further call your attention to the fact that what you so loudly proclaim as a sport is run by you as a commercial proposition. You endeavor to run it on lines which will bring to you a revenue; and if you succeed in making some money, do you give it away to the first person who comes along and asks for it in the name of sport? All "games" are not so run, but the majority are. That is all right if they run as they are and for what they are. It is all wrong when they ask for charity for sport, which on analysis is profit for themselves. As between your club cashier and the public it is a money matter, pure and simple."

"Can I take your ad. for the next issue of the Shooters' Gazette?" queried Quills.

"What special benefits has your paper to confer? In what way does it offer advantages to me?" queried Stubtwist.

"Why," replied the sporting editor, "it is of inestimable and constant value to you. The benefit to you does not commence with the mere incident of the publication of your advertisement. The Shooters' Gazette fulfills a double mission. It is a public educator in matters of sportsmanship and wholesome recreation. Beginning with the boy or mature man, as the case may be, it educates him correctly and purely in matters of sport in all its branches. Without my paper and others like it, the greater part of the present-day shooters would still be using muzzle-loading blowguns to shoot birds, and beanpoles and cord to catch fish. You, as a business man, should be keenly alive to the value of an organ which in sportsmanship educates pupils from the elementary stages up to accomplished graduates. These are the people who buy your goods. When you advertise, it further calls direct attention to what you have to offer; thus you are a beneficiary directly in two important ways. And yet there are few sportsmen who trouble themselves as to how we manage to publish our paper or pay our bills. But we are frequently confronted with a proposition something as follows: Let me illustrate it in this wise: I am A; the other fellow is B, who gets the goods, and C, yourself, represents the donor. B, who gets the goods, says to C, the donor, 'It will be a great bargain for you to get a free reading advertisement with A, and if you will give me a gun I will see that you get it; for, to promote the sport and to retain my friendship, A will gladly publish the story of your munificent generosity, which I will write to him, thus you, C, will be paid by A for goods received by me.' Between A and C, there has been no transaction whatever. I, under the flimsiest of silly pretenses in this silly juggle to secure something for nothing, am supposed to satisfy both parties. If that is a good principle, why not introduce it into business transactions generally? But I understand, Mr. Vine, that after all the free advertising I gave your tournament, you destroyed the scores of your 'game' so that I would not receive them. Is that true?"

"Yes, that is true," replied Vine. "Why did you not have a representative there in person to get them?"

"For the same reason that you sent your free advertisements to me by mail. You did not deliver your advertisements to me in your own proper person, nor was it at all necessary that you should do so. To assume that we should pay a staff representative \$25 or \$50 merely that you might hand him the scores is the height of doddering babble. We are supposed to know how to run our own business. At all events, it seems strange to me that you would accept favors to which you had no special claim, which were of material value to you, and in return behave so curiously."

"I have the goods, anyway," remarked Vine.

"You have more now than you will have in the future," remarked Lord Stubtwist.

This is a simple story of a mythical land of the blowhards of Blowland; and it has been said by some very wise men that those gentle folks have been scattered over the face of the earth, and that the race is far from being extinct. BERNARD WATERS.

SIX MONTHS, \$2. }

NEW YORK, SATURDAY, DECEMBER 12, 1903.

VOL. LXI.—No. 24.
No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

TRAIL HORSES.

WHEN Mr. Emerson Carney writes of life in the unsettled West, as he often does, he always writes to some purpose, and what he says is likely to strike a responsive chord in the heart of some reader, who in bygone years has followed the elk through the timber, climbed the peaks for mountain sheep, packed over the rough trails of the Rocky Mountains, or ridden hard and fast amid the dust kicked up by the flying buffalo herd.

The note printed elsewhere this week, in which the ability of horses to follow a back trail is commented on, will bring before the minds of many men, who have had experience in the West, affectionate memories of some horse, which, on the darkest night, could always be depended on to carry his rider back to camp, or which, going into some region where he had perhaps been only once before, and of which his rider had forgotten many of the landmarks, would follow his trail of long ago with the utmost exactness, pursuing so devious a course that his very twistings and windings would recall to the rider the memory of the previous journey by showing to him at frequent intervals objects that he remembered to have seen before.

This trail finding instinct is entirely distinct, we imagine, from that sense of locality which all horses possess, and which often causes a large proportion of a bunch of range horses that have been driven to some distant quarter from the range where they were born and brought up, to turn about and make their way back to the old home range. Every horse breeder in the West has from time to time suffered from this homing instinct, which exists in horses, and in a less degree in horned cattle, and which we may believe is common to most mammals and to many birds.

As Mr. Carney says, there is the widest difference among horses as to the possession of this back trailing instinct. Some horses do not have it at all, others may be absolutely trusted to take one into camp, or to find their way along any trail over which they once have passed. A horse which will do this is much more than a mere riding animal, and one comes to feel for him the affection and confidence that one has for a beloved dog or a dear friend.

We have in mind two or three horses, now owned in Montana—back trailers always to be depended on. If the rider of one of these horses happens to be caught out late at night in thick timber, or among rough rocks, or in broken prairie, far from the camp, all that need be done is to drop the reins on the animal's neck and let it go. At a swift walk, which must almost be four miles an hour, it swings along toward its destination, pausing for no obstacle, sliding down the steep sides of ravines, plunging into creeks, scrambling up almost vertical banks, with mind always intent on the business of getting back to camp without delay. A person unused to riding might well enough be alarmed and uneasy at being carried so swiftly and so steadily through the darkness, and among rocks and tree trunks and other obstacles; but the horse, with ears pricked and eyes ever searching the darkness ahead and on either side, moves forward without pause.

As Mr. Carney says, it seems to be the little horses, and perhaps the Indian ponies most of all, that have this faculty of back trailing, and we have thought it was more often seen in good horses than in bad ones. Horses possessing spirit, speed and generally desirable physical and mental qualities, seem to have it more than the horses that are lazy, slow and of little value. This means only, we presume, that the most intelligent horses are the best back trailers. We have more than once seen this quality possessed in surprising degree by good buffalo horses and good war ponies.

As the West settles up more and more, and roads take

the place of trails, and trails pass through hitherto untrodden valleys and forests and mountain sides, this faculty of trail finding will become less and less needed, and will no doubt ultimately pass out of use. It is one of the phases of the old wild life, which like the buckskin clothing, the buffalo robe bed and the butcher knife carried in the belt, has no place in civilization.

A DEER hunt was planned at Lakewood, N. J., for Saturday of last week. The affair was organized on the carted-stag hunt system of England, in which a tame deer is carted to the scene of the start and liberated, to be chased across country with horse and hound. This hunting has long been followed in Great Britain, where the Royal Buckhounds were an institution until the accession of King Edward VII., by whom the establishment was discontinued. It is not a form of sport that has received or ever will receive general countenance in this country, and the thing that happened at Lakewood last Saturday was just the thing which might have been expected. When the men and women and horses and hounds gathered for the start, and the devoted deer, described as a creature of the size of a greyhound, was brought up in its crate, the officials of the S. F. P. C. A. interfered, and declared that any person who took part in the chase would be arrested under the provision of the law reading: "Any person who shall capture, torment, or overdrive any animal shall be deemed guilty of a misdemeanor and fined not exceeding \$250 and imprisoned for six months." The projected deer hunt came to an end then and there; an anise seed bag was substituted for the live game, and the hounds had their run. The teaching of the incident is that there is a long felt want in the world of ultra sport, to the filling of which the scientists and inventors of the day might profitably address themselves. The live deer being impossible because of the awkward penal code complications, and the chase of the anise seed bag lacking spice because the bag has not muscles and nerves, and blood, there is call for an automobile deer, geared to the speed of a Fifth avenue red devil and equipped with a dirigible attachment like that used for torpedoes, to be controlled by the M. F. H. The invention and perfection of such an accessory of sport is quite within the scope of the inventive genius of the day, and instead of wasting the time in useless expostulations with the S. F. P. C. A., the Lakewood deer hunters should consult Edison.

THE newspapers have just published the obituary of a well known clergyman whose life was one of usefulness and power and good. Yet by one of the idiosyncracies of association which give spice to life, it happens that our one thought of this man for years has been that he was of the class of individuals who appear to have an honest belief that the game laws were made for the control of all the other folks on earth save only themselves. This reverend Doctor of Divinity would kill quail out of season, and stoutly maintain that there was no harm in it—for him. He apparently could not recognize that he was not by virtue of his calling and election superior to the every day average common gunner. There are many others who have just this feeling of superior immunity; every profession knows them, every country witnesses their lawlessness. They are fewer, perhaps, now than they used to be, for the better education as to game protection and the growing public spirit in indorsement of game preservation mean the creation of a common sentiment to which even these superior beings must confess themselves amenable.

DARKEST Africa is setting an example to enlightened America which may well be followed. In the *Cape Times* not long ago appeared the report of the annual meeting of the Game and Trout Protection Association, of the western districts of South Africa. This report indicates that the protection of game over large districts is being well looked after. The laws for the preservation of big game were opposed by many residents, who endeavored to have the close season curtailed, but these attempts were promptly vetoed by the government. Moreover, it has been found necessary to establish special close seasons for certain kinds of game, as well as for certain species of birds which are not properly game. Moreover, in the Bushmanland division of Namaqualand, a large tract of country has been set aside as a game

refuge, in which it is forbidden to kill, hunt or trap any description of game animals whatever. Certain species of antelope still exist in this country which have long been on the very verge of extermination. There are said to be about 650 blesbok, 275 bontebok, 250 reitbok, and 340 zebras.

A generation or two ago, these ranges swarmed with these species, and with a number of others which are now extinct. It may be hoped that the protection of these few survivors has not come too late.

The setting aside of a game refuge in South Africa shows that at last public sentiment is aroused in favor of big game protection. Like action ought to be taken in the United States, in many of the forest reserves of the West.

A PARTY of Brooklyn policemen, who went shooting in Pennsylvania the other day, have made much of a grievance of their experience with New Jersey game wardens, who confiscated their game. To reach home the Brooklyn men had to pass through New Jersey, and when they took the birds from the cars to the ferry the constables seized them as game in course of illegal export. The losers deserve no sympathy, because they had already violated the Pennsylvania law by taking the game out of that State; it was in the nature of illicit and contraband property, even before it reached the Jersey City ferry. Brooklyn policemen should advise themselves of the laws governing in the country they resort to for shooting.

RESIDENTS of Huntington, Long Island, have appealed to the authorities for relief from the nuisance of the Sunday shooter; and the game protector tells them that it is not within his province to interfere with the Sunday shooters, as their offense is not a violation of the game law, but of the penal code. This is true. As a penal offense the Sunday shooting should be not difficult of correction. It is an unmitigated nuisance when done in the vicinity of a town or in the neighborhood of a dwelling; and the officials whose duty it is to suppress it should be given no rest until they have bestirred themselves.

THE Christmas Number of FOREST AND STREAM, the issue of December 5, has been received with decided favor and appreciation; and kind words in praise of its beauty of illustration and interest of contents have been coming from readers in all parts of the country. The common verdict is that it is the handsomest issue of the FOREST AND STREAM ever printed.

WE print to-day a number of responses to the inquiry as to the season's woodcock and ruffed grouse supply. Other communications on the subject are of necessity deferred until next week. We trust that still other correspondents who have been afield will favor us with notes of their observations of the condition of the covers.

MR. CHARLES CRISTADORO's report of Heron Lake ducking affairs demonstrates that Executive Agent Fullerton is still doing good work. The Heron Lake market-shooters have been active and defiant; but the recourse to the courts could have had no other outcome than that of a finding against the holders of illicit game.

THE New York Journal illustrates an article on Long Island duck shooting with a picture of a shooter training on the game a monster swivel-gun, or punt gun. As this mode of shooting is forbidden on Long Island waters and almost universally in this country, the Journal's punt gun picture is sufficiently ridiculous.

It is worth while repeating here what is said in the announcement on another page, that the opportunity to secure books at very low prices is open to all subscribers alike, whether new or old. The opportunity should be one which will put thousands of the world's best books into the hands of new readers.

THE annual meeting of the New York Fish, Game, and Forest League was held at Syracuse last Thursday, December 10. A report of the convention will be given in our next issue.

THE FOREST AND STREAM of January 2, the New Year number, will contain a colored supplement printed in twelve colors.

The Sportsman Tourist.

In Old Virginia.

XIII.—Billy.

ONE morning, just after the family assembled for breakfast, a little darkey rushed in and in great excitement announced:

"Dey's a man out heah wid a sho' 'nough live deah foh Miss Lady."

Breakfast waited while everyone went to see the deer.

At the back porch they found a colored man carrying in his arms a beautiful little spotted fawn, evidently but a few days old.

The little animal lay curled up in the man's arms as quiet as a pet kitten, turning to look with mild curiosity first at one and then another of the admiring throng surrounding him.

"I ketched him day foh yistiddy," explained the man, "but didn't have time to bring him 'long 'til to-day. I was crossin' de fiel's back of Cap'n Liggets, takin' short cut home, w'en I walked rite up on de old doe, layin' in some thick sedge grass, 'en she des up an' sneak off like a ole haar, an' de little feller tried to foller' long, but he was so on-stiddy an' wabby on his legs, dat I des make one big jump an' grab him 'fore he git started. He kick an' scromble a little, an' den lay still, like you see him now."

"W'en I git him home de ole woman feed him wid a little rag soaked in milk, an' we shut him up in de cow shed foh de night. Nex' mawnin' he foller us des like a dog, an' now he would'n' go 'way at all."

"He would have foller'd me all de way heah, but he ain't much on de walk yit, an' so I bin totin' him."

Knowing the object of his visit was to find an opportunity of turning his embryo venison into coin, after further admiration, the ladies broached the subject of the price set on the deer.

"I don' know des how much he wuth—a rite smaht, I reckon—but he too pooty to eat, an' I ain't got no time to look aftah him, an' den I say to myself des soon as I drop on him, dat I was goin' to bring him to Miss Lady, an' now you kin have him foh what you say is right."

This is a shrewd way of trading often pursued by the wise ones when they know the vendee. The transfer was arranged, to the satisfaction of all parties, and in a very short space of time the fawn had a new home and name.

A seven-foot picket fence surrounded the house, inclosing about four acres of ground divided into front and backyard, flower and vegetable garden, and this was considered sufficient range for one small deer, even when shut out of the garden, which he would often have to be; and the high picket fence was believed to be an effectual barrier against any inclination on his part to rejoin his wild friends, so Billy was named, and released in the backyard.

He took kindly to his new home and friends, and soon learned to distinguish the voice, and even step, of his young mistress. The first characteristic observed was an abnormal bump of caution. Billy was suspicious of everything, animate and inanimate. He assumed nothing, and took no chances. Every object with which he came in contact was subjected to a careful, searching and exhaustive examination from every point of view.

With the inanimate objects on his range he was soon on fairly familiar terms, but with his living associates, consisting of human beings, fowls, cats, dogs and occasionally pigs, he got on slower. His manner of expressing distrust and surprise was to jump in the air. If an old hen near-by clucked, he jumped moderately high. If a cat lying asleep in the sun wakened suddenly to find his little black nose investigating near her face, and swelled up and spit savagely, as cats will, he jumped very high, and sometimes more than once.

If the pigs in the lot came near the fence, he would approach and gaze intently at them through the palings, as though wondering what manner of things they could be, until one would suddenly grunt, when he would go half across the yard in a succession of high jumps. His star acrobatic feat, however, was always reserved to express his surprise and indignation when the old pea fowl screamed; then he jumped high, fast and furiously, and generally lit running.

No effort was apparent in these really remarkable jumps, nor did he ever make any preparation for them. He seemed set to go off at any surprise, and never missed—or hung—fire. Friends he made, deliberately and carefully, but he had no intimates and permitted no liberties. At the call of his young mistress he would come running, but unless she wanted to feed him, he would remain with her but a short while. He would eat table scraps, such as bread and vegetables, positively declining anything greasy. Standing on the porch, some four or five feet from the ground, his mistress would feed him bread, which he would reach by standing on his hind legs, balancing as cleverly as a trick spaniel.

Shortly after Billy arrived at the age when he put off fawn colors, and donned the real deer coat, he was one day observed walking along the fence which separated him from the forest trees. After walking the entire length of the fence, apparently carefully inspecting for openings, he calmly jumped over to the other side as though the fence was three, instead of seven, feet high. After walking around the grove of trees outside for some time, he strolled up to the fence, and, without apparent effort, jumped back again. From that time on Billy came and went at his own pleasure.

Such good use did he make of his newly discovered privilege, he was soon heard of visiting plantations miles away, and frequently returned blown and excited, having been chased by dogs. Fearing that someone might shoot him by mistake, his young mistress provided him with a bell as a safeguard. This he was rather inclined to resent, at first, but soon became reconciled to it, and would jump and play about apparently enjoying the sound of the bell. He finally got to

losing his bells in the most mysterious manner, going off with a bell firmly strapped around his neck and slipping home without so much as the strap.

This occurred so often that it became both troublesome and expensive to keep him belled, and finally a collar of bright cloth was substituted for the bell as a distinguishing mark.

The mystery of how Billy lost his bells was finally solved by some disinterested spectator, who had observed him busily munching a turnip held in the left hand of a colored individual, while the right hand of the aforesaid colored gentleman was removing the bell from his neck. The bell might have been of more value than a bit of succulent vegetable, but not to Billy; and he did a thriving business in bells while his stock lasted.

He made friends in his wanderings with some of his wild kinsfolk, and would occasionally return from a tour in the woods accompanied by one or more wild deer.

Generally some of the excitable darkeys would discover them first and put them to flight, often chased by the dogs, in which event Billy would jump over into his yard, where he was safe, leaving his wild friends to look out for themselves.

Billy was sensitive to changes in the weather, and on the eve of a storm would be excited and restless. He would run back and forth across the yard stamping the ground with fore and hind feet, at the same time blowing shrill whistles.

The advent of his horns seemed to afford the little fellow much food for thought, and that of a serious nature. He would lie around in the shelter of the yard shrubbery, turning his head often from side to side as though listening to the horns grow, or in wonder as to what was going on, varying this occasionally by long, gentle rubs on the rough bark of convenient trees.

A misfortune befell the first (and only) pair of horns that Billy grew. When about one-half developed, and in the velvet, he wandered off from home and was captured by a colored individual, who hoped to gain a reward by returning him. It not suiting his convenience to start at once, he dragged Billy into a shed and tied him up with a strong rope. Rebelling against such treatment, the deer struggled desperately until he broke one horn partly off and injured the other so that it grew into a deformity.

Almost dead from loss of blood, and much broken in spirit, he was returned to his devoted young mistress, who promptly proceeded to reward his captor—not as he expected—but as he deserved. Regaining his strength, he resumed his wanderings, sometimes remaining away for two or three days, and occasionally returning hard pushed by the hounds, but retaining throughout his love of home, and affection for his mistress.

Then one sad day he came home in a wagon, accompanied by a very penitent young hunter, who explained as best he could why he had shot a deer wearing a bright band of crimson cloth around its neck. But it did not matter as to the "whys" and "wherefores." Billy, the beloved, was dead, and all his grief stricken young mistress desired was that his slayer finish his explanations and apologies, and take himself off, leaving her with her sorrow.

Many sincere tears were shed for the loved and lost pet, and his memory has survived the lapse of years. If allowed to elect, the story most frequently requested at story time hour—if mama is narrator—is "The 'tory 'bout Billee."

LEWIS HOPKINS.

Grizzly Bear Bottom.

You who have read the Journal of Lewis & Clark's Expedition, will remember that frequent mention is made of the grizzly bear. Sometimes they called it the "grizly," sometimes the "white," or "brown" bear. Regardless of color, these bears were all, of course, of the one variety, *Ursus horribilis*.

Except in parts of California, nowhere else in all the land did the grizzlies attain such immense size as those which made their home along the course of the Yellowstone and Upper Missouri rivers. From the time of their birth, everything was favorable for their rapid and continuous growth. The valleys of these streams, deep, wide gashes in the rolling plains, were warm and sunny when all other parts of the country were fast locked in the embrace of winter. And the timbered bottoms and slopes of these valleys fairly teemed with game of all kinds, the buffalo, the elk, mountain sheep, deer and antelope, in countless thousands furnishing abundant food for the bears at all times. If they were too fat and lazy themselves to kill meat, there were always carcasses for them to feast upon; buffalo mired in the quicksands of the river, various other animals killed by the wolves in wanton sport. And then in the autumn, what a feast of hardy fruits they found; plums, wild cherries and vast thickets of bull berries. Their kindred in the mountains retired to their dens in November, and remained there until April, and even to the middle of May. And when they did come out, they were forced to travel day and night in search of food. The females, nursing a litter of young, had little milk for them, and the cubs were stunted in growth from their birth. The bears of the river valleys, however, did not den for more than a couple of months on an average. Indeed, they were to be found wandering around at any time during the winter, whenever a warm chinook wind set in. Even the females remained in good condition the year round. There was always an abundance of meat, their teats were always full of milk, and their young thrived and grew amazing fast. When a year old, they were nearly as large and heavy as a two year old of the mountains, and when they attained their full growth, were of almost unbelievable size. In 1882 one was killed about forty miles below Fort Benton, which was estimated to weigh eighteen hundred pounds. Its hide was considerably longer and broader than an average cow buffalo robe.

Accustomed to pounce upon and kill the buffalo, even the huge bulls, crushing the skull with one blow of their terrible paws, it is little wonder that the grizzlies had no fear of men, and attacked them often without any provocation whatever. The Journal relates a number of instances of this kind, and several times the men of the expedition had narrow and exciting escapes from

the dreaded animals. Yet such was the indomitable courage of this little band of explorers, that they seldom let pass an opportunity to attack and kill a grizzly with their clumsy flintlocks. What a brave set we modern hunters are, to be sure. We have the .50-100; the high power .35 caliber, and are still seeking something better, something that will absolutely annihilate a grizzly with one shot. How many of us would try conclusions with one of those old time bears, had we nothing but one of the fukes which the early explorers and voyagers used!

In the afternoon of May 21, 1804, Lewis & Clark passed Snow Creek (they named it Pine Creek), and camped in the next point of timber above it on the south side of the Missouri. Just below the timber some of the men discovered a very large bear asleep in the open plain, and fired a volley into him. Up the old fellow rose and with a roar charged them, with such surprising speed and fury that three of them, dropping their guns, jumped over a twenty foot cut bank into the river. And the bear also leaped out, and struck the water only a second or two behind them. The two or three men who had not been obliged to take to the water, lost no time in reloading their guns and firing at the animal, luckily succeeding in killing him before he could overtake any of their comrades.

That point of timber still stands, and under some of its ancient and gnarled old cottonwoods, the explorers built their evening fire, and feasted upon the tenderer portions of their quarry. The Missouri river has changed its channel many times in many places during the past one hundred years, but at this point it is evident that there has been no change for very much more than a century. Just back of the rather narrow bottom the slope of the valley rises abruptly, up and up to the distant level of the plain. And opposite, on the north side of the river, is a broad, level flat, ending at the water's edge in a cut bank some forty feet in height. Nor can there be any doubt that this was the very spot where the expedition camped, on that May night, for under date of May 22d the Journal relates that after breaking camp and resuming the voyage, at a distance of five miles they came to a stream emptying into the river on the north side, which they named Gibson Creek, in honor of one of the men, a sergeant of the command, a name which it bears to this day. The creek is exactly five miles above the point of timber, and two miles above the Round Butte, a most remarkable cone-like hill about a mile south of the river, visible to the voyager for many miles above and below it.

Nothing is more satisfactory to the student of the early history of our great West, than to go over the ground the brave pioneers explored and locate the exact scenes of their trials and splendid achievements. Here, for instance, in this point of ancient timber, one can camp beneath the very trees which sheltered Lewis & Clark and their men for a night. Nothing has changed there in the hundred years which have elapsed since they tied their boats to the shore and built the evening fire, except that the buffalo and the elk have disappeared forever. Deer still frequent the thickets and pine-crowned hills. Goodly numbers of mountain sheep are still to be found among the sandstone cliffs which rim the edge of the valley; and there, as of yore, one is lulled to sleep by the long-drawn, melancholy howl of the wolf. Indian or white, there never yet was a wanderer of these plains who did not love to listen to their deep-toned notes, and think upon the weird and melancholy thoughts they seemed to be trying to express.

Yes, and the grizzly still roams the bottoms of the river thereabouts and the bad land breaks which extend far back into the plains. This very point of timber has been the scene of more than one exciting and sanguinary encounter with them.

In the spring of 1860, three employes of the American Fur Co., at Fort Benton, were ordered by the Factor to go to Fort Union, the company's post at the mouth of the Yellowstone, and report for duty there. They were: Malcolm Clark, trader; John Neubert, tailor, and another, one Carson, a cordellier. Of the three, Neubert still lives. He is a prosperous cattle man, and has a ranch on the Teton river, a few miles north of Fort Benton. Clark, a black haired, black eyed, swarthy colored man of splendid physique, would have held an important place as an officer of the great company, for he was very shrewd and intelligent, had it not been for his fierce and ungovernable temper. He had not the tact, patience, and forbearance so necessary in one who had to deal with thousands of Indians, who were all powerful, veritable lords of the illimitable plains. It was this terrible temper of his which finally led to his untimely end, for he was killed by an Indian youth he had raised, who could no longer bear his blows and abuse. But Clark was a brave man, often foolishly brave. Nothing pleased him better than an encounter with hostile Indians or wild beasts. He loved to make blood flow.

Having received their orders, the men patched up a small skiff, threw in their bedding, a sack of salt, some tea and a kettle to steep it in, and started down the river. Think of that, ye latter day hunters! Tea and salt only for a trip of five hundred miles! The men of those days subsisted on meat straight, and were content.

On the 21st of May, by a strange coincidence, the voyagers landed at the very point of timber where, fifty-four years before, to a day, Lewis & Clark had made their camp. They had been pulling steadily down stream since daylight, and were tired. The sun was still an hour high, but they had yet to kill some meat of some kind for their evening meal, before making camp. Beaching the skiff just below the timber, they climbed the bank, and saw a variety of game, buffalo, elk, and deer, grazing here and there in the open sage brush flat. But much nearer to them than any of these was a huge grizzly, just shambling into the woods.

"That's the fellow we want," said Clark. "He'll furnish us a plenty of good fat. Some slices of it skewered onto a good big piece of broiling meat will give it just the right medicine."

Both Neubert and Carson objected to having anything to do with the bear. But Clark insisted: "I'll trail him up myself," he said. "You fellows post yourselves just back of the timber, and if I fail to kill him he is bound to come out and give you a fair chance at him."

Accordingly, Neubert and Carson went part way up the length of the timber and posted themselves on the slope of the hill, where they could obtain a good view

of the long and narrow bottoms. All three of the men were armed with Hawkins rifles, muzzleloaders, of course, but the most serviceable and accurate weapon of those days, carrying thirty balls to the pound.

Clark waited until his comrades had stationed themselves on the hill, and then entered the timber, following the bear along a narrow game trail which penetrated a dense undergrowth of willows and tall rose bushes. The animal had been leisurely sauntering along the path, sniffing and pausing here and there to tentatively tear up a pawful or two of old leaves and earth, or to roll over a decaying log. The hunter soon sighted him, standing in the trail about twenty yards away, and hastily fired at him. The ball pierced the animal's lungs, too far back and too high to affect the heart, and the next moment, with a terrible roar, the great beast came bounding towards him. Clark raised his rifle and struck a furious blow at his assailant, but the bear dextrously caught it on his paw and sent it whirling to one side. Then, before the man could draw his knife, the animal struck him a mighty blow on top of the head, and he fell in the trail unconscious.

After they heard the shot, and the bear's angry roar, Neubert and Carson waited and watched for several moments in silence, and then they saw the animal come slowly out of the timber, blood dripping from his mouth and nostrils. He was quite close, and when he turned broadside to them, they fired simultaneously and had the satisfaction of seeing him drop in his tracks. One of their balls had broken his neck. They shouted for Clark. "Come on," they cried, "we've got him."

There was no answer.

Again and again they called, fruitlessly, and then they went in search of him. In a few moments they found him where he had been stricken down; he was still unconscious, his hair and head were covered with fast clotting blood; they felt of his pulse, and found that it still beat with some little force.

Right there they built a fire and brought their bedding, and having made Clark as comfortable as possible, one of them went out and cut some meat and fat from the carcass of the bear. They broiled the steaks, and brewed some tea, and ate their evening meal. But still Clark never stirred. They washed his face with cold water again and again, but even that did not arouse him. The clotted mass of blood and hair on his head they did not touch, for they feared, and rightly, that the skull was broken, and they had no faith that their clumsy fingers could repair the damage. Midnight came and the full moon rose above the horizon. Even with the light it afforded there was danger in resuming their journey, for in many places the channel was in the dark shadows of timber and high cut banks, where the treacherous sawyers were thickly strewn. To run into one of them meant a stove in boat, or at least an upset. Yet they felt they must start and get their companion to Fort Union as soon as possible. They made a soft couch of their bedding on the bottom of the skiff, laid Clark upon it, and pulled out into the stream for their destination, still two hundred and fifty miles to the east.

On the next day, when only forty or fifty miles from the Fort, they met an exploring expedition, with which was a skilled surgeon. He examined Clark, who was still unconscious, and offered to return to Fort Union and do what he could in the case, an offer which Neubert and Carson only too gladly accepted. What a remarkable circumstance that was, that the only surgeon within a radius of a thousand miles or more, should appear at the very moment his services were so urgently needed. Arrived at the Fort, a careful examination revealed the fact that Clark's skull was badly fractured, a three-cornered piece being sunk in and pressing on the brain. The surgeon understood his business, however, and skilfully trephined the fracture, and the patient in a short time fully recovered from the injury. Clark's wonderfully strong constitution had helped him through what would have been certain death to the average man.

In 1872, Louis Meyer—known to all old time Montanans as "Dutch Louis"—had a woodyard on the opposite side of the river, and just below this point, which may be truthfully called Grizzly Bear Bottom. Louis had several men in his employ and was engaged in furnishing cordwood for the steamboats which plied up and down the river between St. Louis and Fort Benton. His shack and stables were at the upper end of a very large patch of cottonwoods some two miles in length, and more than half a mile in width. Here was a favorite resort for the game which frequented the woods, and even to-day one would have to travel far to find a place where white tail deer are more plentiful. It is an ideal shelter for these wary and fleet footed animals, in places quite open, and in other parts supporting almost impenetrable thickets of willows and rose brush.

In those times, and even as late as the early eighties, the "woodhaws" never went to their work unarmed, for skulking war parties of Indians from various tribes were abroad. Many a nameless grave in many a bottom along the upper Missouri, holds the remains of some forgotten wood chopper; shot down by ball or arrow, while at his work.

One Sunday morning the men rose late. Louis had prepared breakfast. There was a bountiful supply of plain food, baked beans, sour dough bread, coffee, and stewed dried apples, but no meat. "Some bob cats, or maybe a mount'n lions," said Louis, "hass schwiped our meats what wass hangin' ound sides. Prewer"—to one of the men—"you are the pest shod, so you will dake your gun and go kill somedings."

Brewer finished his breakfast, smoked a pipe or two, and then picking up his rifle started down into the timber. It was in the latter part of November, and there was some snow on the ground. The timber was fairly alive with white tail deer, and there were always more or less elk to be found in it. But the morning passed without a shot being heard by the men at the shack. By mid afternoon they became uneasy. Something, they were sure, had happened to the hunter. He had had time to kill a dozen deer, and should have been back long before noon. About four o'clock they set out to look for him, following his trail, which was plainly to be seen in the new fallen snow. About a mile from the shack they found him, or rather his body, lying in a narrow game trail walled in by a dense growth of underbrush. He was frightfully mangled and torn, his face bitten be-

yond recognizance, the ribs on his left side torn out, exposing his heart. The tracks of a grizzly around about revealed the story. The animal had been lying in wait beside the trail for something to come along that could furnish it a meal. And it had pounced upon Brewer so suddenly that he had not been able to fire a shot. The gun lay near him, a cartridge still in the chamber.

There are still some grizzlies to be found on the upper Missouri, a few at Grand Island, an occasional one about the mouth of the Musselshell, but more in the vicinity of Round Butte than anywhere else. There is one old fellow especially in this latter locality, which the most successful of bear hunters would be proud to add to his string of trophies. His tracks, carefully measured in the damp earth along the river shore are: hind feet, 12½ inches long, 7 inches wide; width of front feet, 8¼ inches. And he must be of great weight, for in places where he has sunk all of a foot in crossing a muddy bar, men have left but a slight impression of their foot-steps. This bear confines himself to certain well known localities, and seems to make the complete round of them about once in two weeks. From the heads of Hell, and Snow, or Paradise creeks, which lie side by side, a narrow ridge dividing them, he comes down into the lower end of the Snow creek bottom, travels up the two mile stretch of timber, and crosses the Missouri about eight hundred yards east of the mouth of Snow creek. Thence he works through the piece of timber where Dutch Louis once lived, and then out to the north among the pine-clad coulees and hills for eight or ten miles, swinging back to recross the Missouri in the same place and work his way up Snow creek.

Mr. John Darnell has a ranch just above the Grizzly Bear Bottom; Mr. James Hall a place at the mouth of Snow creek. Neither of these gentlemen care for shooting, yet they have spent no little time in trying to find this bear, for the old fellow seems to consider their herds as his own. Last spring they found the remains of a cow, a calf, two two year old steers, and two colts which he had killed; and more of their live stock is missing. But so far as known, no man has ever set eyes on this cunning animal. He, as well as most of his kin, seems to have learned in late years that man is something to be feared. He travels about only at night, in the daytime concealing himself in some dense thicket. Following his trail with the utmost caution, the hunter finally hears a "woof-woof-woof," and a tremendous cracking and breaking of dry twigs and limbs ahead where the tops of the willows are madly shaking, and then he comes to the place where the game had lain; by that time the bear is far away, seeking another retired place for his interrupted siesta.

This much the writer has been able to glean of the affairs of bears and men near the Round Butte during the past one hundred years. I would that we could know all that has transpired there since 1804. The stories of hunters and hunted, of the stripes of red men and white, would make interesting reading.

MONTANA.

"Bad Men."

Editor Forest and Stream:

In describing the execution and writing the history of Tom Horn, who was hanged at Laramie, Wyoming, last week, all the newspapers headed the articles as, "A Bad Man."

In Texas Tom Horn wouldn't be considered as a bad man. He was an assassin. Every man he killed was shot from ambush or in a fight of several where the firing was promiscuous rather than concentrated. Under fire in promiscuous firing does not betoken that nerve or courage to win the title of "bad man," as that term is applied where it originated, in Texas. He was hanged for killing a boy thirteen years old. These are not the "spurs" of a bad man, as we Texans know them.

I lived in Texas, and I have seen and personally knew some of her "bad men"—men who earned this title from acts of courage in personal encounters, where to fight was a virtue, to fall a misfortune. The encomiums on the fallen, for his bravery, were as many as for the victor.

Dr. George A. Ferris, who lived in Richmond, Texas, once said that the grand juries of other States made Texas. Meaning that under indictment they went to Texas to escape trial.

Dr. Ferris was a distinguished physician and one of the most courteous gentlemen of the old school. He loved a "thoroughbred" and knew more about a race horse than anyone I ever knew. A thoroughbred to him was a horse of endurance and bottom.

There were at that time (twenty years ago) few mile tracks in Texas. In every county there was a fast quarter horse, and there was rivalry between the counties as to which had the fastest.

In a quarter race lightness of the jockeys didn't count. Everything was in the start with two evenly matched horses. To get the advantage a great deal of bickering would ensue, and it generally ended in a fight with one or more wounded or killed.

Dr. Ferris had a contempt for a quarter race—which depended upon the start and not in the ending. He said there were two things needed on a quarter race track—a six-shooter and a surgeon—and he was right.

Ben Thompson, of Austin, Texas, killed seventeen men, and every one went down with his eyes to the front and a pistol in his hand. In Texas parlance, he gave them a fair shake. Thompson boasted that he never killed a "gentleman" in his life. Thompson's killing was done with a pistol on the street, and over half the men he killed was caused from an insult thirty or forty minutes prior to the shooting. There was nothing of the ruffian about Thompson. He was always the best dressed man in town; in fact, inclined to be "dudish." I never saw him without his hands encased in kid gloves. There was no pistol or belt visible on him. His pistol was carried in front inside his trousers about where the right strap of the suspender button connects with the trousers, and the handle was underneath his vest. At twenty yards with a ball from his pistol he could drive a ten-penny nail into a plank as good as a carpenter with a hammer.

In a moment of danger he never tried to get where the other fellow couldn't hit him, but his impulse was to shoot, without one thought for himself; and shoot he did, and straight to the mark. He died with his boots on, and a dozen bullets, from as many pistols, in his body, without ever knowing who killed him. Ben Thompson, at one time, was marshal of Austin, Texas. His presence alone did more to deter lawlessness than forty policemen or rangers.

I saw the fight in Houston, Texas, between Mat Woodlief (another bad man) and Alexander Erickson. Erickson was marshal, and as the cowboys say, would fight a circular saw cutting both ways, after it had started.

Without particularizing, they met on the street and commenced shooting. Both men fell wounded. On the ground they emptied at each other every ball in their pistols and then crawled toward one another, still snapping the empty pistol, unconscious of the fact that their pistols were empty. Woodlief didn't know what fear was. This absence of fear cost him his life.

Alexander Erickson was the bravest man I ever saw. He was a small man. He arrested criminals and desperadoes without even a pocket knife in his hand. The consciousness of some one hurting him was entirely foreign to his nature. As an officer he carried a pistol, not as an intimidator, but as an "executioner."

Well might the motto on his pistol have been: Do not draw me without reason, nor shield me without honor—and he didn't.

Within my time in Texas (and I am not an old man, either) two stage coaches containing about twenty-three passengers were stopped, and all the valuables of the passengers taken by one man. The robber made them all stand in a row and "hand over." The route was only traveled by one coach, but on account of the large number of passengers an additional coach was put on that day. The robber stopped the first coach and made the passengers get out. When the passengers in the first coach were lined up, the second coach made its appearance. He made them get out and then told them he didn't expect two coaches. That was nerve. A Jew insisted on retaining enough of his money to get his dinner. The robber took all and then gave him back fifty cents, and the Jew got into an argument with him as to the amount being sufficient to get a meal. That was cheek. The robber went off with all the money of the twenty-three passengers, and yet there were many brave men in that caravan, but discretion was the better part of valor. The robber had two pistols out and ready. A shot from one of the twenty-three would have caused the robber to shoot and several would have been killed. That's the way they looked at it. A Thompson, Erickson or Woodlief would not have hesitated. Discretion was the last thing either of them would have thought of. It never would have occurred to them that somebody was going to be hurt.

A fight occurred in Richmond, Texas, between two political factions. Tom Smith, deputy sheriff, with ten men shooting at him, stood beside the sheriff and fired every ball in his gun, then he stepped over and pulled from under the sheriff, who had been killed, his gun, and emptied the remaining shells. He didn't get behind anything, and he was so composed that when his chief fell, although he (Smith) had been shooting, he had kept a record and knew there were several remaining shells in the sheriff's gun, and thus he picked it up soon as his was emptied. That was a brave man.

Tom Horn wasn't a brave man. If he had been he would be living to-day. He was hanged for killing a thirteen-year-old boy.

That's not the courage that brought forth the name of "bad man" in Texas. It's made of sterner stuff.

TOM GILCHRIST.

Ransacker Commentaries.

SHASTA MOUNTAINS, California, Nov. 22.—*Editor Forest and Stream:* After some days of gloomy weather consisting chiefly of wind and rain, making wet woods, dripping pines and roaring streams my environment, the sun is out for a while this morning.

I feel so genial upon these accounts, and after just going over the FOREST AND STREAM of 14th inst., that I cannot refrain from complimenting you upon that particular issue. It is as fat, sleek, graceful, in make up as some of the trim bucks I have sometimes subscribed for in these mountains.

The discussions that often inevitably come up are not least among the good things furnished in these columns. But well may he exclaim, "*Ay de mi, Alhamas!*" who swerves too far from direct, intelligent expression of anything of moment concerning the things within its realm! I had rather be a dog and bay the moon than such a sportsman.

That is a most trim little essay of J. P. T.'s upon the subject of tipping. His sentiments are well worthy of note in the practical and morally correct tablets of all gentlemen. The custom of tipping, as well as the vice of receiving these precarious bribes, is neither commendable nor honorable. It is a custom more honored in the breach than in the observance. It is peculiarly un-American in origin, but it has become a vice of such universal influence as to threaten all civil institutions. Let us all, as worthy sportsmen, smash that target at every snapshot we get.

Hurrah for the Red Gods, blackened timber and smoky Indian, etc., with the raw, jim-dangled saw-log at the end!

The question, Can Fish Count? over the observations of Basil Field, is not to be answered offhand, if at all. In my domain, all last summer I was interested in watching a trout whenever I crossed a foot-bridge over a little stream near my door. A trout of about ten inches in length had his home in a shallow ripple just below the bridge, almost under it. There is a flat stone in the water, about a foot in diameter that has a shell of quartz rock upon it, making it look as white as paper under the few inches of clear water. Over this stone the fish might nearly always be seen if I approached carefully. He made it his lair, or home, for at least four months, and I do not believe I ever saw him twenty feet from it either up or down stream.

I frequently tossed him worms, grasshoppers or morsels of other food, and he learned to do antics for these inducements, or tips, quite as readily as some of the creatures higher in the scale of animal intelligence. He did not shy after I had established my tipnotic influence over him, unless I kept him dancing too long. I found, however, that if two or more persons stepped upon the bridge the fish promptly vanished to one of his hiding places under the banks of the bridge. Whether or not he could count is questionable. Two or three objects upon the bridge looked different to him than one, and he did not reconcile that difference with the object recognized by him as a tipper. It is my opinion that animals do not count. I do not believe they reason by any such mathematical process as men have schooled themselves into using. I would rather believe they act upon intelligence, conveyed by the eye to the impulsive or instinctive mystery that prompts or inspires motion. Two or three men must look more strange and formidable to such creatures than one; it is certain that all creatures with appreciable intelligence distinguish degrees of magnitude and form, for this is one of their most essential natural attributes for their preservation. Even man would not have to count to act upon the impression conveyed by his eyes that two, or a number of enemies are more bulky and formidable than one. He would fear a regiment more than an advance guard. Without other knowledge to guide him he would fear a cow more than he would a wolf or smaller creature. What is it to count anyhow? Men have doubted as to whether two and two were more than three.

RANSACKER.

Have I Remembered?

THE closing scenes of a Christmas eve at home serve to awaken to the broader mind the responsibilities that we owe to the position in life in which we find ourselves.

As principals in these scenes we must become aware in reflective moments of duties left undone, as well as those done. To the one of broader mind, the sin of over self-indulgence need not apply, because he should have that something within him that causes him to remember home circles that are less blessed in this world's goods than his own.

As applied to many sportsmen, Christmas eve at home is an indulgence in the pleasure that he naturally brings to others; it is to him the spring on the sunny mountain side, where he stops in happy contentment, where he drinks to his heart's content from the cup of cheer and happiness.

The Christmas shopping has been done and the purchases made, a pleasure that was only hampered by the perplexity as to what should be bought, not what would it cost. A problem of plenty, a pleasant self-indulgence, making our little world of happiness full and complete.

The fall shooting in the north woods and in the mountains is over. The guns have been cleaned and put aside, but not put away; we only wait for the Christmas dinner at home; and then a furthering of our pleasures afield in the South.

The last good-night has been said, the small footfalls over head have ceased; buried under the down quilts in dreaming silence repose those we love, while the happy mother bends over them, drinking happiness from their warm cheeks.

The fire in the grate has burned low, as though old and lonesome after so busy an evening; a cold pipe is seen on a near-by table, and the master in this house stretches and yawns and declares to himself that 'tis time to go to bed—when Donald comes in—Donald the hero of the field, the pet of the house, Donald, dear old Donald—he goes to his master and lays that knowing head on his knee and wistfully looks up into that master's face. The cold pipe is taken up and filled and lighted, while the smoker places his hand on the dog's head and says: "Ah, pup, we are alone at last, and now we can talk it over. How you carry me back, back to those days when the mountain side was carpeted with rustling leaves all yellow and red and dying; to the sunny swale and the brook where we lunched; to the frosty mornings when you shivered between my knees in your anxiety to bolt from the wagon and hunt before it was time, to our return at night, when you were footsore and were glad to come to heel; to the evenings when you lay by the wood-box and growled at the bare-footed boys as they clustered around the cook-stove to warm their little blue legs. Ah, pup, those were great days."

It is Christmas eve, too; on that bleak mountain side the cold mantle of winter has fallen there, too. On a small plateau at the base of the mountain is a little cottage which at certain seasons of the year we love to visit. It is the home of Henry—Henry our guide, Henry our friend. In the north window of the house a pane of glass is missing (boys, just real boys, live there); and in lieu of a pane of glass a piece of old cloth, part of a discarded hunting coat stuffed with straw, protrudes. Around it the snow has drifted in and melted on the bare floor.

The two lean cows have been milked, the oxen have been fed and supper eaten; the wood-box has been filled, and the outer garments of many patches and colors are hung on the nails back of the stove. Red mitts are unslung from the shoulders of the red-faced boys, and with the home-made caps with ear-warmers of different textures, are thrown in the corner. Baby has fallen asleep in the tired mother's lap; Elmer dozes across a chair; John lies curled up back of the stove; Arthur leans on the table, poring over a six-weeks'-old weekly, while Clara sleeps on the home-made settee under an oat sack. And this, too, is Christmas eve—the calendar says so.

However, to the close observer there could be seen lurking in those sleepy eyes a substantial expectancy, which grows more intense as Henry's heavy boots are heard thumping on the frozen ground without. Nor could anyone question the degree of genuine gladness felt by that little flock as they greet the father after his three-mile trudge across the mountain from the village in the valley. It is with strong pride the father drops from his shoulders the burden he carries, and from it brings to view three pairs of stout cowhide boots with brass toes and red tops, ten yards of twenty-cent plaid goods, a bright red warm hood for Clara, a pink outing flannel dress for baby, and a brown sugar bag full of menagerie candy toys for all.

And now again the patter of footfalls cease on the bare floor above; sticky hands and faces repose in healthy slumber beneath the patch-work quilts, while the mother tucks them in and kisses each one good-night.

The candle grows shorter and the light sputters in its own substance as Henry pulls off his boots and plans fresh inroads on his buckwheat bin to pay for his merry Christmas.

"But ah, pup, what a time we had on our last trip after grouse. Henry, dear old Henry, what an excellent guide he is. But we go south next week, and there, too, we will have a great time. Drop, Donald. Drop, boy, and go to sleep. What fine strapping children Henry has. I wonder if my boys will be so strong and rugged. And this is Christmas eve—have I remembered them?"

When we know what a box filled with a few dollars' worth of genuine Christmas toys will do; when we realize the hearts it will make glad; when we see at what little cost, indeed, happiness can be bought, isn't it a wonder the market is not cornered? And how easy to escape the question, "Have I remembered?"

THOMAS ELMER BATTEN.

Who are these Red Gods that Call?

OUR forsworn heritage, gods of our fathers, gods of our race. Gods of that race that from the childhood of the world has fought on and won, ever opposing an invincible front to ruder barbarism, never beaten but by its own kind; leaving through the ages the high points of its supremacy in the intellectual peak of the Hindu dialectic, the art of the Hellene, the mailed empire of the Roman; the race that spanned half a world while it was yet no more than wandering tribes, that took a new start and has spanned a world complete; the Indo-Germanic race, the Indo-European race—less of a mouthful of words, the Aryan race—in short, our own. And while this race of ours was in its cradle of mystery, when men were young and gods were new, our forbears called their gods "the red ones"; and it answered all their needs, whether of description or of devotion.

A parenthesis—and the implication of a syllogism, for such as prefer their logic formal. "And God said, 'Let us make man in our image,'" and he made him and called him Adam, the red. Now, it is not far to reason back that the god which Abram took with him from Ur of the Chaldees was a red god.

Red were the gods when our ancestors lived afield and were in fearless fellowship with the gods that people every stream in every forest. Red the gods remained while the proto-Aryans swept out from their cradle and peopled the world. Red were the gods who looked down upon the building of Kapilavastu, that first great city that has proved the type of other great cities, even of our own, in which men forget the good gods and go, maybe, color blind, and fiercely query, Who is this man, that he should call the gods red?

Not even a poet may fairly be judged away from his own horizon. Stop a moment and think what was Mr. Kipling's horizon in his childhood when he was pocketing those facts of boyhood vision which become the images and the fancy of maturer thought. His early life was spent in India, where our kinsfolk think no shame to have before their view artistic conceptions of the gods they still believe in. And those gods are red to-day, red by long tradition of the past.

One need but open anywhere the sacred books of our share of the East to catch the gleam of the color. Far in the backward of the ages, when the gods were principles plain to the people of the forest, long before they had been debased into anthropomorphs or zoomorphs, the early Aryan saw his gods red and called them so. In the earliest Rig Veda the color shines out. There is Dyaus, the open sky, the Zeus of the Olympian pantheon, the Jupiter of the Capitolium (yet with a sport of philologic atavism even so sophisticated a citizen as Horace writes, *sub Jove frigido*—"under the chill and open sky"—and last of all the Tuisco of the northern peoples, this latter being a point yet held a problem. Through all these ages runs the influence of the red Dyaus, the first god of forest folk, the arch of the sky. Nor is this the only red god of our early race. The Rig Vedas glow with them. There are, for an instance, the Maruts; red gods are they, and sons of a red god, too, for their father is Rudra. Rudra must have been the reddest god of all, for his name means "the red" in the earliest Sanskrit. And so deeply is the color dyed into the skeleton of that word root that no time has sufficed to pale it, and Rudra of the primeval Sanskrit is no more ruddy than its descendant "red" of which there are those who would question its application to gods, when here we trace the word back to a god that was red because he was a god, a god because he was red. Of the sons of Dyaus, the Aśvins, in the Vedas, one was dark, but the other was red. The earliest worshipped aspect of the sun, the red ball in the sky, was called Surya, the red one, and that has passed along the ages to be the Helios of the Greek and the Sol of the Latin, and with either hand to fill our English speech with the redness of this god. One might heap particular on particular in a very sorites of red proof. But it is not needed and would be no more than curious, for there is an elemental abstract in the same early Rig Veda. All the gods, whether the sacred hymn specifies that they are red or leaves that point of hue unstated, all are grouped under the common name, the Devas, and the Devas themselves are nothing less than the red ones, the shining ones. We have gone astray after many strange gods, but at least we try to assure ourselves that they are not strange, but Devas after all, whenever we use the words "deity," "divine" or "theology."

So, it is no wonder that Mr. Kipling says that red are the gods that call the young men; the rather were the wonder if he were to call the gods other. And not the poet alone with his monosyllable "red" that has had its due effect upon so many great bulls of Bashan. Who is there will not quite as clearly render the redness to the red gods? There may be other tongues of

men in which the gods are not red, but our speech glows with the color of our forefathers' gods, the red ones. We cannot avoid the ascription and the red Credo. Every time we bend to inhale the sweet odor of the heliotrope, every time the reverent hand is lifted over bowed heads to invoke the divine blessing, every time we look at the dial for the solar time, in these words and in scores of others we also say "the gods are red," and we cannot say other.

WILLIAM CHURCHILL.

A Camp-Fire on Fifth Avenue.

A camper's freedom from restraint,
A hunter's plain and simple fare;
Good-fellowship our patron saint,
And when we meet—"begone, dull care!"

THIS small word picture is delightfully descriptive, and illustrates in nice detail the "total abandon" enjoyed by the Camp-fire Club of America and their guests Saturday evening, Dec. 5, at the Aldine Club rooms, Fifth avenue, New York.

The fire was lighted promptly at 6:30, each fellow trying to outdo the other in gathering unflammable material. From the remotest parts of Alaska, from the Sierra Madre mountains, the interior of Mexico, from Montana and Colorado, from Nova Scotia, New Brunswick and Ontario; in fact from everywhere where the footprints of civilized man is less seen, were contributed many bits of unwritten history of wide experiences, until geography so minimized itself that the smell of burning spruce of Alaska, the pine knots of the Sierras, the canyon scrub of Mexico, the dried grass of the plains, the cottonwood of Montana, the jack pines of Michigan, the birch bark of Canada, seemed to mingle and blend, furnishing an aroma of wood scents to gladden all hearts and make every one of the campers next door neighbors.

Never was "begone, dull care," more delightfully exemplified than in Mr. Coffin, the toastmaster of the evening. He was like a child with a new toy that wouldn't "stay put."

The guest of the evening was Mr. Alfred H. Brooks, of the United States Geological Survey. Mr. Brooks' description of his exploration into the interior of Alaska, including in his remarks his attack on Mt. McKinley, contained many interesting details of that vast region of the northwest—of the hardships suffered by both man and beast during his 800 miles' journey by pack train. An added feature of Mr. Brooks' address was his wonderful collections of photographs taken on the journey; the photographs were passed around the tables during his talk, a map of the United States was shown on the wall back of the president's chair, with a map of Alaska in dark coloring in the center, thus showing by comparison the tremendous area of square miles contained in Alaska—on the southern boundary it reached from Savannah to Los Angeles, and from Ohio to Iowa in the center, and covered nearly the whole country from the Gulf of Mexico to the Dominion of Canada.

The other speakers were President William T. Hornaday, whose opening address was a delight to all present. Mr. Hornaday spoke of the splendid lot of talent to be heard from during the evening, and then introduced Mr. Coffin as toastmaster of the evening, and it is needless to say that the selection was a particularly good one.

In introducing Mr. Beard, Mr. Coffin made the remark that all who knew Mr. Beard loved him; after Mr. Beard finished his delightful talk, interspersed with very clever stories, those who had not known him before were ready to yield up their affection there and then.

Captain Merrill, of the United States Navy, entertained the campers with a charming bit of naval history, as well as with some of his own interesting experiences.

Mr. Charles Sheldon, who has spent a great many years in the interior of Mexico, gave a geographical description of that interesting country, which was new to many present, and his description of the game throughout Old Mexico, the different kinds and how they are hunted, excited very keen interest.

Mr. J. H. Seymour is evidently never at a loss to tell not only one interesting story, but a series of them; it was made manifest that with Mr. Seymour each experience not only entertains at the time, but brings to the surface reminiscent thoughts, which delight all who are so fortunate as to be among his listeners.

Mr. Ezra H. Fitch gave a delightful account of his recent canoe trip of over six hundred miles into the interior of the Dominion of Canada, telling of the game seen there, conditions for hunting it and a very interesting history of the Hudson Bay Company from the time of the granting of its charter by Charles II., to the present day; and while surprises are to a great degree lost among such men as the members of the Camp-Fire Club of America, a great many were surprised to learn of the vast amount of territory controlled by this company; Mr. Fitch averred that it covers a greater area of square miles than the United States.

The next to respond to the chair was Mr. Thomas Elmer Batten, of FOREST AND STREAM. Mr. Charles H. Townsend was happily left as the last speaker of the evening; evidently Mr. Coffin served him up as the pie to the meal; his dialect stories were exceedingly clever and well done. Mr. Townsend is one of the new members of the Camp-Fire Club, and judging from the applause he received it was very apparent that he is a valuable acquisition for all time to come at these delightful dinners.

The members present were: A. A. Anderson, L. O. Armstrong, Daniel Beard, W. H. Boardman, Prof. M. T. Bogert, Geo. Wm. Burleigh, H. L. Cadmus, F. A. Coffin, Wm. Edw. Coffin, Dr. C. C. Curtis, E. W. Deming, W. C. Demorest, J. A. Dimock, A. W. Dimock, W. H. Drake, Dr. R. W. Eastman, J. S. Emans, Paul Farnum, E. H. Fitch, F. L. Gamage, Prof. Wm. T. Hornaday, E. H. Hotchkiss, Geo. L. Hubbell, L. C. Ivory, Dr. R. T. MacDougall, A. G. Millbank, A. J. Millbank, Dr. R. T. Morris, Dr. J. J. Noll, Lynde Palmer, Carl Pickhardt, Dr. E. H. Raymond, E. H. Raymond, Jr., Arthur F. Rice, E. B. Rogers, G. T. Rogers, Carl Rungius, Frank Seaman, Edmund Seymour, J.

H. Seymour, Charles Sheldon, O. J. Stephens, C. H. Stonebridge, H. H. Todd, C. H. Townsend, Dr. D. K. Tuthill, Dr. T. K. Tuthill, Dr. H. Vreeland, H. C. Walsh, H. D. Whitfield, Arthur D. Williams, J. Dunbar Wright.

The guests were: John Stewart Tanner, Prof. Livingston Farrand, L. S. Quackenbush, Giraud F. Thompson, W. W. Niles, Dr. E. G. Tuttle, Wm. Townsend Colbron, Chas. Snow Kellogg, Geo. A. H. Churchill, Jas. Boyd Weir, Geo. MacDonald, H. M. Shearer, Juan Gavama, Henry S. Clarke, Royal E. Moss, Dr. J. C. Schminke, Randolph Walker, Chas. D. Marvin, Basil V. Rowe, A. B. Hudson, Jas. G. Campbell, Theo. Morache, J. E. Nichols, F. M. Van Horn, Geo. Hodge, Geo. T. Wilson, Tristram R. Coffin, Ralston R. Coffin, R. A. Franks, Chas. A. Reed, Wm. Schickel, Dr. Caille, Rev. Arthur Jamieson, Com. Henry Merrill, R. A. Gunn, T. E. Batten, H. de Lisser, Mr. Farnum, L. S. Darling.

A telegram of regrets was read from Mr. Ernest Thompson Seton, requesting those present to add to the camp-fire one pine knot for him. T. E. B.

Natural History.

The Night Hawk in Town.

NEW YORK.—*Editor Forest and Stream:* Your correspondent, Mr. Flint, in the issue of Nov. 21, desired observations on the night hawk (*Chordeiles virginianus*) in this city. I have often, on quiet summer evenings, seen these birds wheeling and diving after insects, but have never noticed them, particularly, near any of the city parks. Last summer I observed at least ten or a dozen almost directly over the corner of Barclay and Church streets. They were apparently after a swarm of gnats, and made considerable noise. The call, to my mind, sounds more like "Beesst" than like "Go-walk"—there is certainly the "burr" in it, almost like the note of a cicada. Friends have sometimes pointed them out as swallows, but I have always corrected them by the unfailing mark—the wide, white bar across each wing. I have never heard them called "bull-bats" this side of Maryland or Virginia. I have no knowledge regarding their nesting habits. It would be interesting to know if they actually nest on the tops of our sky-scrapers, but I would incline more to the belief that they nest in the parks, or other wooded places. J. K. HAND.

[Night hawks are quite abundant in this city during the summer, and we have more than once seen what we believed to be a young bird flying through one of the down-town streets in the middle of the day, pursued by a crowd of street boys. The night hawk has been known to deposit its eggs on roofs of buildings in large cities and towns, and no doubt does so in New York. In Vol. VI. of FOREST AND STREAM, page 318, it was reported as breeding on flat roofs of houses at Montreal, Can. It does not commonly nest in wooded places, but rather in open barren spots; thus we have commonly found their eggs lying on the bare rock in mountain pasture lands, on the bare sand on sand bars of rivers, and (probably *C. v. henryi*) on the disintegrated granite of high mountain plateaus in Wyoming. In none of these cases was there any nest, or any apparent shelter or protection for the young.]

NEW YORK, Nov. 30.—*Editor Forest and Stream:* Probably the night hawks in the vicinity of that aristocratic section, Central Park West, this city, are more given to song than their more modest brethren on the south side of the Park and the lower meadow, but, all the same, I have failed to observe that characteristic long sweep downward in their flight and the accompanying note that I lately tried to describe as "Go-walk," and thereby aroused the artistic criticism of Mr. Perkins. Up in the Adirondacks and over farm lands and pastures throughout the State this startling sound is often an object of wonder, and people are curious to learn whence it proceeds. The birds flying over the park may make this note, but from more than fifty observations taken in June and July lasting through several years I have never heard it, although my hearing is good. My observations have been principally confined to night hawks flying over the thickly settled portions of Manhattan.

One night in June, 1900, I was at New Haven, Conn., near the green, and one of these birds awakened me several times by the explosive note. I do not see how "any intelligent listener" to this wild, bold tone could ever disgrace it by a comparison with the dead jingle of a loose bass guitar string. PETER FLINT.

Back-Trailing Horses.

Editor Forest and Stream:

J. B. Burnham's observations in FOREST AND STREAM of Nov. 14, about "scent," reminds me that there have been, in past years, some warm oral discussions among the brotherhood of the hunting trail in the Rocky Mountains, concerning the wonderful ability of horses to follow a trail, as to whether it was done by scent, or just by some natural instinct. It would seem that they have some power other than that of scent, which enables them to follow in the exact footsteps of their own or that of other horses, months after the trail has been made. By the term "trail" I do not mean that of a definitely laid out and used trail, but the term as used here applies to any course through the mountains or forests which has been gone over by a horse.

One season while trapping with a partner, we would sometimes operate in different localities for a time, each having two horses and complete outfit, and all one needed to know, in order to find the camp of the other was to know which way he had started, and once get the lead horse (the saddle horse) on the trail, and he would never fail to take the rider to the camp where the other horses were. In one instance my partner traveled over one of my old trails several weeks after I had passed along, and there was several inches of fresh snow on the ground, whereas the ground was bare when I had gone over it, and by giving his horse his head, to go where he would, it brought him out at the

spot he wanted to go. The horse would occasionally stop and smell of the logs as it stepped over them, but surely no scent could remain for that length of time, yet if not, how could a horse perform such feats? I have frequently ridden my hunting horse for many miles over the rough mountains, through windfalls and great bodies of dense woods, then turn back, and hang the reins on the saddle horn, and never give a thought as to where I was going, and would not only come out at the exact spot where I started in, but would cross every log, go around every obstacle and pass every point at the exact spot as in going. No part of a horse's faithfulness and service ever had the same effect in warranting my affection, as that of bringing me safely and directly home or to camp, by his own good horse sense and instinct, especially if it be away in the night, when it has been so dark in the pine woods that I could not see his head, could see absolutely nothing, when it was so utterly dark as to be almost felt, when I would hang the reins loose and cover my head and face with my arms as a protection against brush, and after hours of such travel, come out where I wanted to be. Such faithfulness in our best dumb friends creates an affection, such as I have imagined Theodore Roosevelt must have had for old Manitou.

Horses appear to differ in their power of scent, or at least in their instinct for direction, just as people do, and as I have observed, the large breeds of draft horses are not nearly so keen in this respect as the small, inferior breeds which are commonly used for pack and saddle animals, and which are descendants of the wild horses of the plains; even among the latter there are some which seem to have no idea of direction, or else have not the intelligence to go as their instinct would direct. It seems clear, though, after noting carefully their actions, that any horse will, when left to himself, and away from home or camp (for any good camp horse comes to regard the camp as home), go in the direction they think is home, and it is difficult to guide them in any other direction after darkness begins to come on.

Night overtook me once many miles from camp, while following a bear, with a very rough and heavily timbered country between me and camp, without any sort of trail to follow, and all strange territory to me. I happened to be riding an old pack horse, which did not want to go the direction I thought camp to be. It was a bright moonlight night, and I was quite certain of my direction, but the horse was so determined on his way that I allowed him to go for some distance, and he struck out in an entirely different direction, when I knew by the moon that he was wrong, and steered him my way, but had to keep a tight rein all the time, until my arm ached. About ten o'clock I rode straight into camp, but not until he was in sight of the other horses did he seem to realize where he was. So, with horses, as with wild animals, no positive rule can be laid down which will govern their actions under all conditions, for they have individuality and are not all born with a like instinct. EMERSON CARNEY.

MORGANTOWN, W. Va.

Note on the Labrador Duck.

In the article on the Labrador duck in FOREST AND STREAM of December 5, it was not noted that the two specimens of the Labrador duck in the Charles B. Corey collection have been in the Field Columbian Museum of Chicago for several years. It is understood that the specimen in the Gordon Plummer collection at Boston was sent to the museum of the Hon. Walter Rothschild, Trivy, England, shortly before Mr. Plummer's death in 1893. At all events, it went abroad, so that the number of known specimens of the Labrador duck in England is 12, and the total known in America is 30.

The Killdeer Photographs.

THE two charming photographs of the killdeer plover which were published in our issue of Dec. 5, were taken in Mexico by Mr. Russell Todd Cornell, a young mining engineer.

Game Bag and Gun.

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Maine Big Game.

BANGOR, Maine, Dec. 5.—*Editor Forest and Stream:* The moose season finally closed on Monday last, and the shipments to and through Bangor for the forty-five days of the open season is reckoned at 196 moose, to which to secure the correct number killed must be added a list of those held by those taxidermists so located that the trophies do not reach them by way of railroads and the express company. This will be considerable, so that the list will be materially enlarged, probably by from 25 to 50 heads, or even more. Probably there are more than this number really in the hands of taxidermists, and, as yet, unreported, but as many of the hunters took their moose home with them, there is liable to be a duplication in the record, especially as at times the same train that carried out the whole animal or a part of it, also took the head to a taxidermist, making an apparent shipment of two moose, where there ought really to be reckoned but one. Still, there have undoubtedly been more moose killed in Maine this year than in any previous season for a number of years. This can scarcely be attributed to the increased number of non-resident hunters, but is readily explained by the statement to your correspondent by a guide at the beginning of the season. He said that those guides who were without business this fall would go into the woods

and kill a moose for themselves, and take it to a market, determining that, somehow, they must make something out of their knowledge of the woods, and where the moose are to be found. A careful perusal of the shipments shows that there was an unusual proportion of the moose shipped by residents of this State, not a few of whom took their moose to the Boston market for sale.

The Commissioners of Inland Fisheries and Game have lately held a meeting in this city, and Chairman Carleton gave the daily newspapers an interview, wherein he gave a most optimistic review of the season's business, and a complete "vindication" of the wisdom of Maine in placing a license upon those outside of the State who want to hunt big game here. It is a most interesting interview, and it is to be regretted that its length makes its reproduction here impossible. One singular feature of it is that the same interview, with perhaps the changing of one or two words to localize it, appeared in an Augusta morning paper, simultaneously with its publication in a Bangor daily. It is quite unusual for two reporters, on different publications, and nearly a hundred miles apart, to so exactly quote a person who consents to be interviewed.

Some quotations may, however, prove interesting reading for the thousands who have been watching for the effects of the first year's application of the new statute.

"We want to be quoted as saying most emphatically that this law has, even in the first year of its operation, proved a decided success, notwithstanding the adverse criticism it has received. It has been claimed that there has been a great falling off in the number of hunters who have come to Maine to hunt this year, due entirely to this law. This is not so. We are prepared to prove that of legitimate, desirable sportsmen there have been about the usual number in the Maine woods this season. * * * We have received and paid over to the State Treasurer this year, to date, in license fees, \$26,650. This is all to be expended in warden service for big game and game birds. * * * More moose have been killed this year than were killed last year, and of deer passing through Bangor there is an apparent falling off of but a few hundred. But it has been said that 'more of our own people have hunted.' This is no doubt true, and will continue to be so in the future. * * * But we want to say a word about the classes that have not come—not any considerable number to be sure—but on account of the noise they have made about their staying away one might be misled as to their numbers. * * * But their number has not been at all proportionate to the noise they have made about it. * * * The so-called 'Ohio and Indiana' parties have not come in any considerable numbers. Where there were hundreds of them last year and year before, there have been scores, and these of the very best, this year. * * * Again, the 'market-hunter' has not come this year. * * * Again, the non-resident workman in the lumbering camps has not hunted to any great extent this year. * * * It is not exactly fair to compare this year with last year, for last year was the banner year—a phenomenal year—every condition for hunting being well nigh perfect. Nevertheless, when you deduct the 'Ohio and Indiana' parties, the number who have hunted without a license for birds and bears, there has been no great falling off, as we have said before, of legitimate, desirable sportsmen. The abundance of deer would apparently safely stand more hunters, but nobody believes that a larger number of moose can be safely killed yearly. * * * The annual reports of the registered guides, made in accordance with law, show that they have earned more money and guided more men more days than last year, * * * their reports to prove it are on file in our office. * * * We want to reiterate that the commissioners are greatly pleased with the great success of this law. Our woods have been safer. There has been but one case of accidental shooting and this was not fatal, by a non-resident, as against nine fatalities last year. We have had a better class of hunters, as a whole, than ever before, and they appear to be well pleased with this law."

It is interesting, in reading this interview, to read in another part of one paper that gave liberal extracts from it, another article by one of Maine's prominent railroad officials, who declared that the business of transporting, caring for and guiding non-resident sportsmen had been cut at least in half this year as against the season of 1902, and stating in the plainest of language that license was responsible for the tremendous falling off in business. He said that his road had not carried nearly one-half the sportsmen during the hunting season up to the close of the moose season, that it did a year ago; that the guides and camp owners were complaining bitterly because their incomes had been cut squarely in half; and predicting that the very men who expressed themselves as satisfied with the Maine license law, would be the first to desert the State as soon as they took a fancy to seek big game in New Brunswick; in fact, he doubted strongly if they would be in Maine next year at all, as the results were so much more satisfactory than in Maine under existing conditions.

The writer knows of one camp where all the parties accustomed to go there for a hunting trip gave up their visit, and all new parties, of whom there were several, cancelled their dates, the alleged reason being the objection to the license law. A camp that entertained forty guests last fall worried through on five or six this season. A camp that was run at a loss throughout the fall, kept open in spite of it, that those regular patrons still faithful might not be turned away and given a chance to form attachments for some other locality—and the cases might be multiplied indefinitely, if there were room.

Inasmuch as people who have to pay a sum for a possibility like to reduce the element of chance from their trip as much as possible, and seek a section where they can get all the license permits, more moose have been shot this year than would, undoubtedly, otherwise have been. The guide who had nothing to do and felt obliged to turn his knowledge of moose and their ways to the enrichment of his own pocket, fared forth into the woods at the first opportunity, and shot his quarry, which was promptly sold to the highest bidder or taken to a city market. To be sure, the profits were scarcely as great as he anticipated in most cases, but that didn't prolong the life of the moose, and the net results to the State at large were hardly up to the value established by Mr. Carleton some years ago, when he announced that every live moose in the Maine woods was worth \$500 to Maine.

If they are worth that much, then the citizens of the State, forced to dispose of some of their gold mine to sustain life, have parted with their birthright very cheaply.

But it is in the suggestion of the railroad official above referred to that one finds the real significance of the cost to Maine at large of the sum deposited with the State officially. If the State sold 1,765 licenses, as has been reported, then fully that number stayed away, and at a moderate estimate of average expense of \$75 each for an outing in the woods, Maine has squeezed her own citizens out of \$132,375 of business that she might realize in license money the comparatively small sum of \$26,650. From one point of view the law has been a success, in that it has created a large revenue for the carrying on of the commission's work, but at what a cost.

Already there is quite a sentiment on the part of the guides and camp proprietors to urge the repeal of the law before another season, but they are powerless, since the law is on the books for two years at the least, and they must endure another season of perhaps more depression even than this before they can offer a protest. Perhaps by that time they will have a better idea of what lawmakers will do if left entirely to themselves, while those whose interests are at stake sit calmly at home and allow others to deprive them of their daily bread. As a money raiser the law's a howling success—this year. As a right or just move, those who suffer from its workings can scarcely regard it as fair or equitable.

HERBERT W. ROWE.

How to Cook a Duck.

Editor Forest and Stream:

Contributors who are discussing the matter of the right way to cook a duck seem to miss the essential point, and that point lies at the south end of the bird. The tail of all waterfowl contains two large oil glands that are used by the bird for keeping its feathers in condition to repel water. The oil in these glands contains organic sulphur compounds in sufficient degree to make a disagreeable flavor and odor. Cut the tail from every waterfowl, and as soon as convenient after the bird is killed—before it is cooked, at any rate—as the sulphur flavor quickly permeates the whole dead bird. I have had the toughest old white wing coots served at the Club in New York many a time, and the boys asked me to please give up my professional work and go shooting again next day. Ducks with delicate flavor, and particularly brant and other geese are ruined in the cooking if the tail is not removed.

Personally my taste for duck is best satisfied when the birds are cooked in one of four ways:

(1) Roasted for about fifteen minutes over a very hot fire, and served rare with jelly and salad.

(2) Roasted for about forty minutes in the baker in front of the campfire, and basted during the last twenty minutes of the time constantly and unceasingly with a spoon tied to the end of a long stick.

(3) Cut into pieces and stewed for an hour in water that has previously been boiled for an hour with pieces of salt pork. The pork fat fills the water in a mechanical mixture so fully, that the volatile flavors of the bird are not abstracted by the water and thrown off as volatile products by the steam. This trick is also the one that gives the secret of successful boiling of fish. Birds and fish are served with the gravy which results from the boiling down of the water.

(4) Dig a hole in the ground deep enough for burying the kettle. Make a log house of hard wood two feet high around the hole. Build a fire in the middle so that the sticks will burn evenly and all drop into the hole at about the same time, in the form of hot coals. Shovel out the coals. Put the kettle into the hole, and in the kettle have the duck cut into pieces, seasoned, covered with water enough to cover duck and a good big piece of salt pork. Put the cover on the kettle, shovel the coals back around and over the kettle, cover with a few inches of dirt, and leave the outfit undisturbed during the whole night, unless the remembrance of a similar feast makes you get up in the night and dig it out.

ROBERT T. MORRIS.

NEW YORK, Nov. 26.

ST. AUGUSTINE, Fla.—*Editor Forest and Stream:* I'm not going to ask whether "you know the blackened forest" where the fire has done its horrid work, but I simply want to stick in a word or two about the fire that is used in cooking ducks. Your correspondent F. W. B. undoubtedly knows what's what, but it's an utter waste of time to fight against fashion.

In my early days there lived in Baltimore a man named Guy—the same who was proprietor of a famous restaurant. That was in the good old days when canvasbacks and terrapins made the time a record breaker in the line of luxurious living, and his fame rested solely on the universally accepted perfection of his canvasbacks, of which I had personal knowledge. Now, a canvasback and a sheldrake are altogether different things, and when we talk about cooking ducks we must consider the distinction. Mr. Guy had the business figured down to a nicety—the stove or oven must be kept at exactly the right temperature, and the duck must remain in precisely so many minutes to a dot, though I forget how many; but they were quickly cooked, the fat outside being in the "crackling" condition of Lamb's roast pig, and just rare enough to be a little red about the bone; and lucky is the man who has run against anything more delicious. In my opinion nothing in the line of luxuries could compare with it except a perfectly managed terrapin stew; but the fashionable "smart set" could not allow themselves to be led forever by a vulgar restaurant man, so one idiot set the fashion of serving them half cooked; then another of the same stripe carried it further, till at last warmed duck became the fashionable thing instead of roast. I dined with one of them, and was promised a canvasback dinner, but one kind of raw duck meat being the same as another to me, and neither being palatable, I had to sit and see them smack their lips over the bloody stuff instead of really enjoying the delicious fat "cracklings" that would have set a genuine epicure like Lamb quite crazy; but they were not permitted by fashion to eat it otherwise. When they offered to help

me I wanted to say, "Is thy servant a dog that he should do this thing?"

Now, when we come to sheldrakes, broadbills, hell-divers, and others of that ilk, the programme changes. Guy would not interfere with the incomparable flavor of a canvasback by bacon or basting, but in the case of the other tribes the case is different. In New York one day I wanted some wild ducks for a dinner party, and went to the market and asked a dealer if he had any good wild ducks. He said he had, and showed me some broadbills. I told him I was too old a sportsman to be fooled with ducks that were fattened on salt water snails. He assured me that they were from the northern lakes, and were equal to anything short of a Chesapeake Bay canvasback. I took his word for it and found that he was right—that it depended on their food. It is difficult to get rid of the fishy flavor of a duck without interfering with the natural flavor. I have often had sheldrakes parboiled about five minutes, and then stuffed and roasted, and found them very satisfactory in lieu of something better.

DIDYMUS.

Grouse and Woodcock.

Editor Forest and Stream:

In your editorial columns on November 28, you alluded to the scarcity of grouse in Michigan, Ohio, New England, and Canada, and you expressed the opinion "that neither the gun of the sportsman, the cunning depredations of the fox, nor, in fact, the attacks of birds or beasts of prey, have had any appreciable effect in diminishing the numbers of this splendid game bird."

The writer knows nothing of Michigan nor Ohio, nor is he sufficiently well acquainted with any of the New England States, except Massachusetts and Maine, to speak with any confidence. But of these States and New Brunswick an acquaintance of sixty years enables him to form a very decided opinion, and that opinion is that in these places "the gun of the sportsman" and the still more deadly gun of the pot-hunter are alone answerable for the scarcity that has, for the last twenty years, been growing more and more evident.

Favorable and unfavorable breeding seasons will generally balance each other; and birds and beasts of prey are diminishing in numbers quite as fast as the grouse; but nothing can make up the drain on any stock that is subject to indiscriminate slaughter. Before the export of grouse was made illegal in this Province, it was a good business for the agents of New York and Boston caterers to travel through all the rural districts of New Brunswick, even to the smallest settlement, and arrange for the purchase of all the birds storekeepers could procure. In many places they would leave cheap guns with young nimrods, to be paid for in grouse at to cents per brace. There was always a ready sale and ready cash for all the birds that were offered; but each successive season saw the supply diminish. From the first of September to end of December, a constant hunt was maintained for many miles around the villages and settlements, until in some localities the partridge was as scarce as the dodo. In Maine the same causes led to the same results some years before New Brunswick was invaded. When exportation was prohibited our local markets offered ready demand, and it was found that the destruction was but little abated.

We have now a law prohibiting killing for three years, which may, to some extent, check the rapid extinction of the bird; but with the yearly increasing numbers of hunters and their guides traversing our woods in all directions, added to the logging camps wherever trees grow, this law "is more honored in the breach than in the observance." I see nothing for it but a continued and increasing scarcity, until ruffed grouse are as scarce in Maine and New Brunswick as wild pigeons.

THE OLD ANGLER.

[The article from which our correspondent quotes was meant to deal wholly with the difference between last year and this year. Of course the gun of the sportsman has had much to do with the diminution of grouse during the past twenty years. All will agree to this.]

BARRE, Vt.—*Editor Forest and Stream:* I had just finished a letter to a friend in regard to the woodcock of 1903, when I turned to FOREST AND STREAM and read the editorial, requesting a report on the birds. The friend referred to spent two days with me in September, 1902, and during that time we bagged thirty-three birds, twenty woodcock and thirteen grouse. In the letter just sealed I had written: "It would have been no trick at all for us to have shot twenty woodcock each day during the last week of last September."

I spend many hours with this royal bird during his stay North, and from close observation of eight years in this vicinity I find it breeds in goodly numbers.

It was easy work this autumn, with good dog, to shoot the bag limit of five birds in a few hours.

I endeavor to keep in touch with its haunts; but each year I locate new breeding grounds. In my old home near the Connecticut valley, the woodcock seldom ever bred twenty years ago, now one may find each summer many broods. I am unable to report the number of flight birds this season from my own hunting ground, but from others have had favorable reports. The game bird which needs speedy protection is the ruffed grouse.

B. A. E.

WHITINSVILLE, Mass., Nov. 28—*Editor Forest and Stream:* I have found more woodcock this fall than last, though not to a very great extent, and they seemed to be more diffused. This past season I shot woodcock on ground where I failed to find any a year ago, and a small cover that gave me an even dozen last year was good for only one-third as many this fall.

We do not get many woodcock in this section at the best. Five birds to a gun for a day's hunt is a large bag with us. We are more likely to get two or three mixed in with quail and partridge.

Partridges have been scarce. I think there were three or four of these birds a year ago where I find one this fall.

To my mind the poor breeding season accounts for it. We had many successive days of wet weather in June, and the young birds were either chilled or could not get

enough proper food to carry them through. It seems to me that the supply of partridges depends more on the successful rearing of the broods than anything else.

This has been brought to my attention especially by the conditions in Maine this year, where partridges have been unusually plentiful in the sections bordering on the backwoods. Reliable people told me that the birds were more abundant than has been known for more than ten years, and my own observations tend to confirm this statement. A year ago the partridges were particularly scarce in this same section of country, and I heard many complaints of parties that were unable to find birds to shoot. Now the fact that 1903 was bountiful and comes directly after the particularly poor season of 1902, can only be satisfactorily accounted for by assuming that 1903 was a good season for the rearing of the young birds.

Quail with us have been more numerous than last fall, and a good many are left over. A good winter should give us many of these birds another year.

C. A. T.

CENTER CONWAY, N. H., Dec. 1.—*Editor Forest and Stream:* The scarcity of grouse or partridge this season does not admit of doubt. For the past four or five years I have shot over this territory every season, getting during each season from sixty to eighty birds. This was shooting simply for sport, and not for slaughter. If I had been disposed I could easily have doubled or trebled these bags.

This season I have not shot over fifteen birds, and I quit shooting them at all in October after I discovered there were so few that we barely had enough for stock for another year.

Now, as to the cause of the disaster to the birds. We had an unusually early spring, or rather promise of spring, so that the grouse disappeared a month in advance of the ordinary season. This naturally influenced the birds to an earlier mating and nesting. About the time the chicks should have hatched we had two quite severe freezes, so severe that much of the fruit and some of our young apple trees were killed. It was these two freezes that, I think, brought death and destruction to the young partridges.

T. P. I.

NEW YORK, Dec. 1.—*Editor Forest and Stream:* In your esteemed paper of November 21 you published a letter from me in regard to the scarcity of game in Connecticut. Since then I have been hunting in New Jersey and have found that birds, particularly partridges, are unusually scarce there, and to-day while in conversation with a gentleman from Pennsylvania who has hunted regularly for years after partridges in the best portions of that State, he stated that there are fewer partridges, or ruffed grouse, as they call them, this fall than any season he has ever known.

Evidently the excessive rains this past year during June destroyed the young; at any rate, some cause affected unfavorably their nesting. Contrary, however, to the reports of the scarcity of game in this part of the country, I have been hearing from South Carolina (where I have been in the habit of going each winter) that quail are more plentiful than usual, and I judge that this is the report rather generally from the Southern States, and trust that I may be able to take a ten days' or two weeks' hunt in South Carolina during January, as I know several extremely good localities.

COURTLAND BARCOCK.

WORCESTER, Mass., Dec. 2.—*Editor Forest and Stream:* Under this heading last week, referring to me, our city Telegram had you to say, "first vice-president of the Massachusetts Fish and Game Commission." What he intended to say was one of the vice-presidents of the Massachusetts Fish and Game Protective Association. What this association wants to know from the sportsmen and pleasure shooters of this State is, What shall we do to save the partridge? There is no question about it, they are way beyond the danger line. We have been shooting old birds all this season. All covers within twenty-five miles of this city, in which a bird could be killed if there, are almost wholly depleted. To say that one or two dry seasons will bring them back is sheer folly. Where are they to come from? Our neighbor States, Connecticut, Vermont and New Hampshire, sent out the same cry before we did.

How shall we save the partridge? I will venture to say that the FOREST AND STREAM will be glad to open its columns to you to tell us how to do it.

A. B. F. KINNEY.

DERRY, N. H., Nov. 27.—*Editor Forest and Stream:* In reply to your inquiry as to our woodcock shooting: One party here who shot ten in one day on the flight, has hunted them every fall for several years, and says there were as many this year as ever. In fact, he thinks they have held their own for the past three or four years.

Partridges are scarce here, but up toward Chester, five miles distant, on higher ground, they are more plentiful. Was up there to-day and started as many as twenty birds, many of them in good, safe covers, where they can defy the dog and gun.

JOHN W. BABBITT.

PRINCE'S BAY, Staten Island, N. Y., Nov. 27.—*Editor Forest and Stream:* Last spring as I was riding up through the Connecticut valley on the N. Y., N. H. & H. Railroad, a man came in and asked permission to sit with me. He got on at some station below Hartford, it matters not where. I remarked that it looked like good woodcock country through here. He said it was; and told me that this spring he had seen more woodcock than he had seen before in fifteen years, and if the birds did well north this season we would have good woodcock shooting this fall. I thought no more of it until this fall, when I then remembered the conversation in the smoking car last spring with a gentleman and sportsman of the old school (which I found out after). More woodcock have been shot since the first day of November on Staten Island than since the year 1893. There are not many bird dogs here; and the birds that have been shot have been flushed and shot by rabbit hunters mostly. Last week one party of four hunters shot eight woodcock in a little bunch of sprouts not more than half an acre in extent, and sev-

eral other parties have shot from one to seven since the first of the month. One man told me he had shot twenty-four since Nov. 1, and he said: "I feel ashamed to tell it." He need not be ashamed of it; if he had been so disposed he could have got twice that number. Woodcock have been so plenty here this fall that men who used to own good dogs ten and fifteen years ago are now thinking about getting another dog. I have seen several gentlemen from Middlesex county, New Jersey, who hunt; and they all say woodcock have been plentiful there.

The fall flight has been large, and the prediction of the man in the smoker became a fact. I have shot none. I have pointed my walking stick toward a dozen or so that I have flushed in my Sunday rambles. I could not help it; the old cane would come to my shoulder instinctively. ***

In Nebraska.

NOTWITHSTANDING the fact that all the conditions for capital sport on the marshes this fall could not have been improved upon, the shooting has not been up to the standard, save in isolated instances, of the average season. The fact is, the issue of the birds from the north, up to within a few days, has been far short of that of ordinary seasons, and the usual morning and evening flight has been confined largely to local birds, and which, as anomalous as it may seem, have been more abundant than they have for years. Especially was the crop of bluewing teal an enormous one, and all through September and October it was these birds that generally furnished the best sport. But like the upland plover, the bluewing is a delicate little fellow, and it requires but a few white frosts to cause him to raise his azure sails and hie himself off to the sunny Southland. But they are all gone now, and the greenwing has taken his place, along with the larger members of the wild fowl family. The greenwing is a hardy little campaigner, and he will linger here with the cautious old mallard until well into January. While I repeat, with the exception of the past few days when the flight has been a big one, the birds have come down from the north only in meager numbers, the shooting has been more than tolerably interesting on most all of the favored grounds, and many bags of goodly size have been reported. That the average gunner takes his autumnal outing too prematurely to insure the best results on the most desirable birds, has only again been exemplified by the fact that most have already used up their vacation time and are compelled to stand idly by and see the main issue of the winged hosts from the hypoborean world pass over unmolested.

But as I have many times said before, it is not alone the killing that renders these trips as so charming and enjoyable. While a fair amount of shooting enhances them immensely, beautiful weather is the principal desideratum after all. Cold winds, sleet and snow are poor concomitants to camp life. It is the hazy atmosphere, the golden sunshine and soothing winds the outer craves in the fulfillment of his joys in the field and on the marsh.

The long continued stretch of delightful weather with which we were favored here all through October, and up to within the last two or three days, has been unquestionably the cause of the backwardness of the birds in coming down from the Polar lands this fall. At last, however, a decisive change has broken in on the charming placidity of old Boreas, and the sportsman who cannot get away is electrified with the sights he so longed for earlier in the season. All through the first two open months the birds were evidently content to linger and revel within the still salubrious climes of their summer home in the north, and it was only adventurous and straggling flocks and bands that were induced to start upon their southern pilgrimage. But now that the first burst of winter, with its boisterous breezes, cold rains and snow flurries is upon us, the winged hordes are all on the move and rushing over and by us in countless thousands. The present flight is a very voluminous one, which the paucity of visitors during October made most probable, but it will only be the luckiest of gunners, he of the superabundance of time, who will profit by it, for the birds will linger here but a brief time; in fact the bulk of them are rushing onward without as much as deigning us more than a passing glance. From the rim of the Arctic circle to the sunny shores of the big gulf, the conditions this year, so far as feed and water, have been unsurpassed, and the birds have not had, nor will have, any pressing occasion to linger or dally upon any of the intermediate grounds. The same favors that would be accorded them here will greet them at the end of their journey in the fair lands of the South.

As with the ducks, so it has been with the jacksnipe. The sport on these royal little sprites of the bogs has, up to within the past week, commensurately disappointing. Not that as many of them have not found their way into the capacious pockets of the canvas shooting wammuses as should justly find lodgment there under any circumstances, the unusually attractive conditions everywhere existing led the always ambitious sportsman to believe that he was going to have the grandest shooting that has been his lot for many a long year. Last spring there were more of these precious little gallinages killed in this section of the country than has been known here in more than a quarter of a century, and the natural expectation was that the birds would come again this fall in the same glorious plenitude. But identically the same causes that deterred the ducks kept the snipe back, until now, on the nocturnal frost ridden winds, along with the geese and the quackers they are hurrying over and by us to lands that are always smiling. Of course there was jack shooting here, and good shooting, at that, all through the mellifluous October weather, but by all former signs and tokens the best snipe time has passed, and what shooting that remains will be poor indeed.

And the geese. They were also equally tardy. Up to within the past two days but few bunches of Canadas have been seen cleaving their aerial way southward, and the cackle of the speckle front and white goose was an infrequent sound in the grand chorus of

October days. Just now, every morning, long lines and wedge-shaped flocks streak the steely skies with most exhilarating frequency, and the sonorous auh-unk, auh-unk, unk-unk-unk mingles with every blast of cold wind and drowns all other sounds in the sportsman's ears. Sport on the Canadas out along the sprawling Platte should now be excellent for six weeks to come.

While the chicken shooting was all that a reasonable gunner should have expected, it was not quite so easy for him to kill a wagon load as he anticipated, and it is to the present wise law regulating the slaughter of this bird you can turn for an explanation of this mystery. Oct. 1 is plenty early enough, as I have frequently, and I hope forcibly, stated in these columns, to open the season on this long since doomed bird, and had it not been for the extensive onslaught by conscienceless shooters in his ranks during the latter days of August and through September, the legitimate October gunner would have been rewarded with plethoric bags without much exertion. As it was the bulk of the birds were killed off in many sections before they were hardly strong enough to clear the long prairie grass, and this, too, despite the vigilance and activity of our wardens. While they have done much good work, it is but a drop in the bucket compared with what they will be enabled to accomplish in another year. They have the recalcitrant districts pretty well in hand now, know what to expect and will undoubtedly supply the necessary remedy. While Chief Game Warden Carter differs with me as to the advisability of prohibiting chicken shooting before Oct. 1, I think the present season's results will go a long way toward convincing him of the soundness of the wisdom of the men who drafted the bill and the legislators who made it a law. The great number of big, strong birds that have been able to thwart the efforts at their annihilation by the unnumbered hunters who have swarmed our fields this fall, and which have been left over for another season, should convince him that an earlier open season means total and speedy extermination. With the lawless gunners once under control, the continuation of the chicken in fairly good numbers for years to come is assured, and as this control is something Warden Carter will in a little more time securely compass, the outlook is really encouraging. With the stoppage of the sale of birds in the open market, and even a moderately due observance of the law as it stands, means much to future generations of sportsmen.

All true lovers of the gun, after the beneficent fruits of the law have been appreciated, will be content to await the coming of October, when chicken hunting and chicken shooting will be unhampered by legal restraint. And, by the way, there is a vast difference between chicken hunting and chicken shooting, as many an ardent adventurer has discovered long ere this. In August or early September there is no sport in either. It is too laborious and too oppressive to trudge through dried stubble, sere grass and flowing corn. Even if you or your dog is so fortunate as to locate a covey of soft, flabby, pin-feathered, slow flying chickens, there is no skill required to exterminate the whole flock in this season, and the slaughter is attended with neither enthusiasm or excitement.

It is true to a preponderance of tastes, a chicken or a grouse is at its best for table purposes when half or two-thirds grown, but this is argument in extenuation of this unlawful killing, and a full grown bird at all times is sufficiently toothsome to answer all gastronomic requirements.

In October, all panoplied with hammerless and shells, the sportsman will find the very acme of healthful sport in the chicken fields. Side by side with pointer or setter ranging in front, these comrades of the hunt will tramp the fields, the sandhills and draws and in the lazy atmosphere of golden days find such enjoyment as is undreamed of by the midsummer marauder and buccaneer. Besides the actual pleasure to the hunter from the fact that he is engaged in an honest recreation, there is a still greater delight to be derived from the surrounding charms of waning sunny days. Shut up, perhaps, in store, shop or office all through the hot period, the sights and sounds and odors of the droning country will seem altogether new to them. Such an outing, with the birds fairly plentiful and strong enough of wing to test their keenest sight and steadiest of nerves, is a revelation of another existence, yet each enchanted faculty brings back to them memories of other days just like these, of other comradeship, of other scenes, but none more beautiful or more beloved.

To such a hunter the morning and evening piccolo of the meadowlark, as he perches proudly on his cream-colored pillars on fence post or sunflower stalk, never sounded half so plaintive, half so sweet. The ruddy-breasted robin, too, hops nimbly and fearlessly along the dank bank of creek or swale, or darts across the yellowing hay field, emitting from his yellow beak a sharp, petulant staccato, that to the hunter is also a lilt of melody, which he alone seems to appreciate and understand. The modest flowers of early fall, the moose hoof, the adder's tongue, wind flower, Indian plume, aster and lobelia open their tender faces, seemingly to greet him, their old time friends.

And more and more. He faintly catches the caw-caw of the sable crow, streaming low over the fields in funereal train on slow flapping wings; the mystic, far-sounding chick-a-dee-dee-dee of the vagrant solitaire, the low, guttural yak-yak-yak of the little lavender sapsucker as he laboriously hitches himself up and down the white-barked cottonwood, and the never ceasing twitter of the marshalling blackbirds. From off over the low sandhills, from the river and marshy expanse, now and then comes the honk of the early goose or the startled quack of the mother mallard who has nested and raised her family in the bordering morass, while from afar above falls the shrill cry of the Cooper's hawk, soaring sublimely or poised on moveless wing, intent upon some unwary rabbit or crouching quail. Then, again, the broad prairie, with its endless undulations of yellowing grass, as silent, mayhap, as the tomb, brings with it to his senses a gratifying intoxication.

But after a while comes the somber day when the birds lock their merry throats, the pointed blossoms

close their eyes, and over the limitless landscape, gray and bleak and still, through the barren hills and leafless groves, across the coldly lapsing lake and dreamy marsh, and into the shadowy valley, comes marching—noiselessly, imperceptibly—but sure and certain, the advance guard of a host—frigid, white and deathlike—soon to hold full sway and make itself everywhere heard and felt.

But look! There is old Spot on a dead point, just at the edge of that bedraggled stubble, yonder.

Now for a double!

SANDY GRISWOLD.

OMAHA, Neb.

Canvasbacks at \$20 Per Pair.

ST. PAUL, Minn.—A friend of mine last winter gave me quite a dissertation on market-hunting at Heron Lake in Minnesota. He had been up there during the fall, and found he was "up against it." The market-hunters saw that the gentleman sportsmen got plenty of experience—if they got no ducks. In his case a market-hunter took a stand not far from my friend's decoys and effectually spoiled his shooting, turning the ducks every time.

All this was bad enough, but when the market-man sent a load of No. 6 around my friend's head it was high time to take notice. My friend had carried with him a Winchester rifle to try on geese and mallards flying high. Taking up his rifle he sighted the water line of the market-man's skiff and proceeded to make a sieve of it as the market-hunter pulled for the shore.

This was but one of the many disagreeable episodes of a day's hunting on Heron Lake while the market-men held sway. But all things come to an end. Mr. Fullerton, the State Game Warden, got wind of the matter and arrests and seizure of guns followed.

I had counted on a hunt with Mr. Fullerton this fall, but he had his hands full at Heron Lake. There was something doing up there. Two wagonloads of canvasbacks and redheads had been seized and the men who were behind the game, the receivers of the goods, caught, as the immaculate Devery would say, "with the goods on them." In all there were a round 2,000 birds. The men "higher up"—the Chicago commission men—hired a lawyer. There were all kinds of charges made reflecting upon the integrity of Mr. Fullerton, making it appear that any and all transgressions of the law were upon his shoulders, and that the local commission men were as spotless as the driven snow. But the worst and severest charge made against Fullerton was that he had appropriated the ducks to his own private use—in fact, had eaten up the 2,000 ducks. If this charge were true, one might have imagined pin feathers cropping out on Fullerton from head to foot.

But, nothing daunted, Fullerton went ahead, and word comes down from the north that a verdict has been rendered at \$10 per bird, or \$24,980, for there were just 2,498 birds found in their possession with intent to sell. But the verdict was modified to \$20,000, because that was all that was asked for in the pleadings. It is not for a moment supposed that the Supreme Court will reverse the verdict.

Mr. Fullerton is enthusiastic, naturally, over the outcome. The gang has boasted immunity from danger. They were well organized and snapped their fingers at the law.

I saw another friend yesterday who had recently been to Heron Lake, and he tells me that the market-hunters have turned toward legal and proper pursuits, guiding for a living. The majesty of the law has been vindicated. A few thousand Fullertons scattered methodically from Maine to California would mean much for the game preservation of the country. CHARLES CRISTADORO.

A California Day.

SAN FRANCISCO, Cal.—Beginning near Monterey in central California and running eastward is a relatively arid strip of territory; the rainfall, which is confined almost exclusively to the winter months, averaging about nine or ten inches. From the first of August until November water is exceedingly scarce, in consequence of which all wild birds and animals concentrate in the neighborhood of the infrequent water holes and springs.

I killed my first deer in this region nearly forty years ago. At that time this game was very abundant, and the hunter was liable at any time to run across a grizzly. Now, however, the bear is only a memory, and deer are scarce. Small game, such as quail, cottontails, and hare, are yet abundant.

I have recently returned from a deer hunt in this belt, whither I went in company with H., my companion of many hunting trips.

Breakfasting very early one morning on this last trip, I suggested to H. that I would go up the cañon and secrete myself near a water hole with the hope that a buck might call to get a drink before lying down for the day. H. decided to go in the opposite direction after cottontails, as the quail season was not yet open.

I got to the water hole at daybreak and found a comfortable hiding place on a high bank about thirty yards from the water hole. The latter was of about the dimensions of an ordinary hand wash basin, and was situated at the roots of a clump of willows near the center of a dry water-way.

I had sat probably ten minutes, when out of a brier thicket near by there hopped a dainty little cottontail, who made direct for the water. Before beginning to drink he sat up and looked quickly around. He then applied his muzzle to the water, and, to my astonishment, kept it there more than a full minute, taking deep draughts. Having finished, he hopped back into the thicket. After a short period of waiting, I heard in the chapparal behind me the soft *Coo, coo* of a quail piloting his flock. Presently he emerged from the undergrowth about fifteen feet away, and immediately discovered me. He cocked his eye at me and uttered a warning *Cheep, cheep*. I sat perfectly still. He moved a few feet away and took another look at me. A number of others now joined him, and all carefully surveyed the intruder. Curiosity satisfied, the whole bevy descended the bank to the spring, leaving a picket on a nearby limb. Meanwhile two other bevs were approaching the drinking place from different

directions. Two or three skirmishers were always in advance, and nothing escaped their vigilant eyes.

The dry waterway was some forty yards broad, and was dotted here and there with a small clump of undergrowth or a cottonwood tree which interfered but little with my view. Within thirty minutes there gathered within my view between 350 and 400 quail, of whom only fifteen or twenty could drink at one time. The thirsty waited their turn with impatience, and frequently two cocks would meet near the water and fly at each other precisely like a couple of bantams.

While intent upon this scene, suddenly a picket, perched near the spring, uttered a quick note of alarm, and the whole bevy ran for cover.

Simultaneously there appeared, first a hare making cautiously for the water hole, and about twenty feet from him, screened by some weeds, a large sized, powerfully built wildcat. Just before reaching the water the hare stopped, reared up and looked carefully in every direction. The cat lay perfectly still, glued to the earth. The intensity of its emotion was displayed by a blood-thirsty glitter of the eye, and an uncontrollable tremor of the short, stumpy tail. The hare, seeing no danger, went forward and began to drink. In a few seconds he hopped away a few feet and again scrutinized the surroundings. A second time he returned to the water, this time with his rump directly toward the cat. Feeling perfectly safe he drank long and deep. I was so interested in the spectacle that I spoke involuntarily: "Now, Bob, is your chance." But the stupid cat spoilt the play. He lay hugging the ground instead of advancing and springing. The hare having finished returned the way he came, with the cat pursuing him behind the screen of weeds. In about five minutes the cat returned, evidently disappointed of his quarry, and crouched in the edge of a thicket near the spring.

The quail now began to emerge from their hiding places. I expected the cat to stalk them, but he paid no attention whatever to them.

At this juncture I suddenly lost interest in both cat and quail, as on the opposite side of the cañon, some hundreds of yards away, I saw a deer cross a narrow opening in the high brush. His direction was toward the spring, and after ten or fifteen minutes he crossed another opening some two hundred yards away. When fifty yards nearer he exposed himself fairly and I fired my little .30-30 carbine. He turned and plunged along the hillside, giving me another shot. After a couple of jumps he stopped, collapsed, and rolled heavily down the steep hillside into a buckeye thicket. ROEEL.

Manufacture of Firearms in Liege.

LIEGE, Belgium, Oct. 14.—The manufacture of firearms and guns in Liege has steadily increased since 1880, and the exports thereof have increased in like manner. The exports to all countries during recent years were as follows:

	Francs.	
1898	15,000,000 =	\$2,895,000
1899	16,500,000 =	3,184,500
1900	18,000,000 =	3,474,000
1901	19,000,000 =	3,667,000

The United States is one of the principal markets for the firearms product of Liege, especially for guns costing under 25 francs (\$4.82). Grades beyond that price being subject to a high duty in the United States, a large exportation of the better qualities is prevented; nevertheless, the demand from the United States for the higher grade of guns is greater at present than at any previous time.

I am reliably informed that certain manufacturers turn out a large quantity of guns having imitation Damascus barrels attached. This, however, cannot in any way injure the reputation of the firearms manufacturers, most of whom are thoroughly reliable in the quality of their products.

In the year 1901 the export of firearms and gun barrels to the United States amounted to about 2,800,000 francs (\$540,400), and in 1902 to over 3,000,000 francs (\$579,000), the proportion of gun barrels and firearms being about equal.

In the last ten years the production of Damascus and steel barrels has increased, the annual production being about 500,000, of which about 100,000 single and 160,000 double barrels were sent to the United States.

The Damascus gun barrel is made principally at Nessonvaux, eight miles from Liege, but in this consular district.

Manufacturers report that many American houses buying from Liege factories do so through agents, and say that it would be more advantageous to importers to deal directly.

JAMES C. McNALLY, Consul.

Game Protection in North Carolina.

GREENSBORO, N. C., Dec. 2.—*Editor Forest and Stream:* Bird and Game Warden W. J. Weatherly, who works under the direction of the Audubon Society of North Carolina, made in the express office at Greensboro a few days ago, three seizures of partridges which were being illegally shipped out of the State. One package contained thirty dressed birds, the contents of the other two amounted to seven and one-half dozen undressed birds. They were sold at auction.

The birds were packed in egg crates with two layers of eggs on the top of each box. The packages were billed as eggs and were being shipped to produce dealers in Washington, D. C. Two of these shippers have since been convicted and fined \$20 each and costs, and at this writing Weatherly is out with a warrant looking for the other man. T. GILBERT PEARSON, Secretary.

RALEIGH, N. C., Dec. 5.—There is much interest both on the part of bird lovers and sportsmen as to the first year's work of the Audubon Society of North Carolina. Special inquiries were made of the secretary, Gilbert Pearson, of Greensboro, as to the results of the year's work under the law enacted by the last Legislature. By the persistent efforts of the society's wardens along the coast during the past summer the colonies of gulls, terns, and skimmers (storm or flood gulls) were for the first

time in fifteen years unmolested by plume hunters. As a result of this protection, about 2,000 young birds are known by the wardens to have been reared.

There is a marked difference as to the duck and goose-hunting in the eastern waters this season. Secretary Pearson says the first attempts in Currituck to hunt ducks at night were stopped by a warden, and the guilty persons, two of them, were fined \$20 and costs each. He says since then there has been absolutely no "fire-lighting" in that county, according to reports made to him. A northern visitor, writing to FOREST AND STREAM from there confirms this statement. Reports just received from Dare county say there is no fire-lighting there. Currituck and Dare counties contain the most important duck shooting waters in this country.

Many resident and non-resident sportsmen there are becoming members of the Audubon Society, after seeing the work it is doing. Twenty-six game wardens have been appointed throughout the State, and now hold the Governor's commission. They are doing a really wonderful work toward creating a better sentiment for bird and game protection. Thousands of warning notices have been posted and 50,000 leaflets distributed, these telling of the game laws. There have been four convictions for violating the Audubon law regarding the killing of song and insect-eating birds, and within the past 90 days there have been twenty-three convictions for violations of the game laws, such as killing before the open season, shipping partridges out of the State, etc. Three seizures of partridges which were thus being illegally shipped have been made and two convictions resulted with heavy fines and confiscation. A warrant is out for the third person engaged in this traffic. F. A. OLDS.

Illicit Shipping of Game.

The annual report of the Secretary of Agriculture gives the summary of the year's work of the Biological Survey in the enforcement of the Lacey law, as to the shipment of game:

"The cordial co-operation of the Attorney-General and State officials has enabled prompter disposition of cases arising from the illegal shipment of birds and game than ever before. Thirty-five such cases, involving the shipment of 3,729 birds, were reported to the Department, a decrease of four cases and about 1,300 birds from those reported during the preceding year. Since the passage of the act 40 convictions have been secured in cases passing through this Department, and about 20 cases are still pending. Efforts have been concentrated upon one or two areas in the West, where illegal shipments seem to be especially frequent in order to secure more satisfactory results with the limited means available. Illegal shipment of game has been very frequent in the past, and various methods have been adopted to conceal the character of the shipment. The violators of the law have, however, been driven by increasing insecurity in their illegal trade to new devices. Thus, a consignment recently seized in the Northwest disclosed game birds concealed in bales of hay which had been forwarded by slow freight. In the attempt to curtail these illegal shipments, I have been much aided by the co-operation, cheerfully and cordially given, of express and railroad companies, and there is reason to believe that illicit shipments can, at comparatively small cost, be reduced to a minimum and the great inroads they make upon the game of our country checked."

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Cuvier Club's Annual.

Around the festive board once more

We greet each Cuvier Son,
All bound together by the tie
Of fishing rod and gun.

Clasp hands together in our joy,
Ring out the sportsman song—
The feast is spread, now drink the toast,
For merry years and long.

—Virginia G. Ellard.

THERE may be some who, hearing of the Cuviers only when their annual banquet is announced in the papers, may think that this is the main object of the club. This is by no means the case, the banquet is simply the rounding off of a year's hard work, and is held at a time when the members may enjoy some of the fruits of the club's determined efforts in the protection of game, and spend a few hours in pleasant social intercourse.

The causes which have made the club the success and power which it is are the preservation of fish and game from certain annihilation by those who are either thoughtless or mercenary, in the interest of the food supply of future generations, and to afford healthy and pleasurable sport in hunting and fishing; the collection of specimens of natural history, and the exhibition of the same in a museum for the education of those interested in the study of nature, and forming an additional attraction to the city. The club is also ready at all times to aid in forest preservation and the propagation of fish and game.

Of late years the club has undertaken the scheme of interesting the pupils of the public schools in the work. Money prizes have been offered in the three different grades for essays on birds and bird life. This plan has awakened much interest, and the club has received about 520 essays; these are read and prizes awarded by competent judges. Residents of the suburbs and hilltops are unanimous in saying that song birds are very much more numerous since the inauguration of this plan, and that the club thereby has created a small army of protectors of

bird life. The Audubon Society holds its meetings at the club rooms, the museum is free to the public, and the club, in every way possible, encourages the study.

It is the wish of the Cuvier Club to extend its field of usefulness. It especially wishes to make it educational in a marked degree for the benefit of the public and the public schools, and therefore desires many additions to its library and museum, and a more thorough protection to fish and game. The club is now overcrowded in museum, library, banquet hall, and in all its departments, and wishes to erect a building which shall contain a museum of treble the capacity of the present one, a large lecture room, music room, reception rooms, and a banquet hall capable of comfortably seating 500 or more. There are about 450 members on the rolls, including some of the best business and professional men in the city. In the past few weeks about fifty new names have been added. The club is vigorous in its efforts to enforce the game laws, and has prosecuted about twenty cases so far this season, securing convictions in the majority of cases. Having briefly stated the objects of the club, and still more briefly referred to the work it is doing, some reference to the annual banquet, the thirtieth, held on Nov. 24, is in order.

The officers of the club worked hard to make this occasion a success and their efforts met with a full reward. Those having general supervision were Alexander Starbuck, president; Judge Peter F. Swing, Henry Hanna and P. E. Roach, vice-presidents; W. J. Lawler, secretary. A special committee consisting of A. J. Conroy, chairman; J. M. Kennedy and George Gerke, had charge of the banquet. The invitation committee was composed of E. G. Webster, chairman; J. H. Hibben and H. A. Verhage. The house committee consisted of Luther Parker, chairman; G. W. Trowbridge and J. A. Burgett. Max Basse, the chef, has served many dinners for the club, but never did he serve a better appointed or more perfect one than on this occasion.

Promptly at 5 o'clock the members and invited guests began to arrive and were met with a hearty welcome extended by President Starbuck or some other member of the committee, shown to a table, presented with a menu, and, with the cordial words "Enjoy yourselves," left to the care of the waiters who were ready to attend to their wants.

The reception hall of the club house was decorated with roses, chrysanthemums, smilax, evergreen and potted plants. Over the door leading to the banquet hall was the word "Welcome" in Virginia laurel and immortelles. In the banquet hall the decorations consisted of evergreens festooned along the wall, and from the ceiling palms, ferns and potted plants placed about the room, and in the rear, facing the entrance, a large floral piece with the words "Thirtieth Annual" was suspended from the ceiling. Silver and cut glass gleamed and sparkled, and, with candelabras, cut flowers and fruit, formed the decorations of the tables. The museum and library were also used by the banqueters and were decorated with flags, evergreens, palms, ferns and flowers. In the library a large table was spread and here the members of the famous Pelee Club met and enjoyed the interchange of their fishing experiences in past seasons, scarcely less than the material entertainment offered by the menu. Stringed orchestras were hidden behind screens of palms and ferns, in both the banquet hall and museum, and rendered popular music during the evening.

At every table hunting and fishing were the topics of conversation, and the guest who could not tell at least one experience was not in it. Some of the fish caught were record breakers, and some of the shots made would cause a champion to turn green with envy, but when a crowd of sportsmen get together a little drawing of the long bow is expected and is excusable. Some of the older ones present had fished in about every State of the Union, and in all the best Canadian waters, and had caught every species of fish from minnows to tuna, and it goes without saying their reminiscences were intensely interesting. Others had hunted every kind of game which wears feathers, fur, or hair, and were not behind in their stories of adventure. Altogether it was such a gathering of sportsmen as is rarely seen. BONASA.

CINCINNATI, O.

Angling in Japan.

MANILA, Philippine Islands, Oct. 30.—*Editor Forest and Stream:* At 8 A. M., October 16, 1903, three of us, two Americans and one Japanese, started in jinrikishas from Taipei, the modern capital of Formosa, or Taiwan, to go to the house of a wealthy gentleman about eight miles up the river which runs through the valley of Taipei. The way led through a beautiful and fertile country, the valley covered with the second crop of rice and the hills with the famous Formosan tea shrub.

After luncheon and after photographing some head-hunting savages we found there, we proceeded to fish for salmon trout, at an altitude less than 250 feet above sea level, and in latitude about 24 deg. 40 min. north, practically in the tropics. The temperature of the stream was about 70 or higher, and the water was well aerated. This stream, from sixty to one hundred yards wide, is clear and full of rapids and riffles. We used Japanese tackle, horse-hair line and horse-hair leader (the latter consisting of one strand only), a bamboo rod and a most delicate palmer tied on a small barbless hook. The rod is decidedly good, and weight for weight is stronger, and a better caster than our jointed rod. It rarely weighs over four ounces—mine weighed about two—but the line is practically worthless for casting, as we understand the term. The fly is perfect, but the hook lacks strength, and the fish when hooked may easily detach itself in a current or an eddy, or by fouling the line. We all know how it is done, from our experience with pin-hook and thread in the brooks at home.

The Japanese, however, have another method of fishing, which may be as new to some of our readers as it was to me. It is quite successful. They catch one fish in any way they can, and then fasten the line securely through its upper jaw, passing it through the roof of the mouth and out at the top of the upper jaw, well in front of the eyes; and then attach through the body of the fish not far in front of the tail, a horse-hair, to which is tied a three-pronged barbless hook, which trails in line with the fish and a few inches behind, while it is slowly

worked up the stream by the fisherman. The theory is that other fishes, seeing the captive moving along as though feeding or perhaps spawning, will pursue it and become impaled on the hooks. In point of fact that does happen, as I saw a Chinaman take two fine trout in this manner.

Our success with the flies was poor. We got thirteen or fourteen fingerlings, but we saw the fish we wished to identify caught in fairly good numbers by the Chinese fishing with decoys. Doubtless with large flies and better tackle than we had, we might have had fine sport.

It seems unusual to find a member of the *Salmonidae* family so near the sea-level in such altitudes. The fish is the *Plecoglossus altivelis*. It has no spots, but iridescent lines along its sides, parallel to the long axis. It has also the adipose dorsal fin. The snout of the male at this season overlaps and turns downward somewhat as does the snout of the male Chinook salmon late in the season. The *Plecoglossus* weighs from one one-fourth to two pounds, is vigorous and shy, and as dainty a fish for the table as any that may be found.

After a few hours' fishing, we descended the river in a rather clumsy, flat-bottomed boat, racing down the rapids and sculling through the smooth places, until we found our rickshaws, and then home. All along the smooth water about dusk we saw the *Plecoglossus* leaping after flies.

Might not this fish be planted in the waters of our Southern States? I shall be pleased to furnish any information in my power to any one interested in this subject.

E. C. CARTER, Major U. S. Army.

The Growth of Trout.

Editor Forest and Stream:

The rate of growth in fishes is not only interesting to the fishculturist, but should be to the angler as well. The subject has not received the attention it deserves, and reliable data is always welcome. The first question that naturally occurs to a person on seeing an unusually large fish is, "How old is it?" This query has been propounded to me hundreds of times, and if the fish is from wild waters the invariable answer has been, "I do not know; it may be 5 or 25 years old." I offer the following examples of the rapid rate of growth possible under favorable conditions, hoping that others may be induced to furnish similar authentic examples within their ken.

Brown Trout.

In the fall of 1899 a mixed lot of trout fry was assigned to Hon. C. W. Hoffman by the U. S. Bureau of Fisheries, which were placed in a pond on his ranch a mile from Bozeman, Mont. Last summer he took two brown trout (*Salmo fario*) from this pond, each weighing 6 pounds, one of which is now in a pond at Bozeman station. Its length is 24 inches from snout to base of caudal fin, and 27 inches to the end of the fin. These trout are four years old.

A few months ago I saw a mounted specimen of the same species taken in a tributary of the Yellowstone River, near Livingston, Mont. The length of this fish was 27½ inches from the snout to the base of the caudal fin, and 30 inches to the end of the fin, and was said to weigh 10 pounds. The age of this fish can be stated only approximately. It undoubtedly came from the Yellowstone National Park, as the only plant of this species in connecting waters was by the U. S. Bureau of Fisheries in 1890, in Nez Perces creek and Firehole River. I regard the growth of these fishes quite remarkable considering the low temperature of the waters in which they were taken.

Brook Trout.

A year ago last summer Mr. Hoffman's son caught on the fly, in the pond referred to, an Eastern red-spotted brook trout (*Salmo fontinalis*) that weighed 3½ pounds. This fish was than three years old. It was one of the mixed lot mentioned. Two brook trout were caught in a tributary of the Madison River, in this State, that weighed 1½ and 2 pounds respectively. These fish were of a lot of fry assigned to Mr. Wm. Gilmer by the U. S. Bureau of Fisheries, and when caught were but one and a half years old, being taken in the fall. Two brook trout weighing 1½ pounds, of the same hatching, were taken the same fall in Bridger creek, near Bozeman station. The low temperature of the Rocky Mountain streams seems to be eminently suitable for the Eastern brook trout; and, moreover, their food is plentiful. I have heard of other instances where brook trout have been caught of even more remarkable growth for age, in trout planted from this station, but the evidence was not so reliable as to exact weight.

Steelhead Trout.

The first steelhead trout fry planted from Bozeman station was in the summer and fall of 1897. They have been caught during the past year or two up to 4 pounds. One lot was planted in Mystic Lake, a very deep mountain lake, twelve miles from Bozeman, where they have done well. Another planting was made in a mountain lake above Pony, Mont., where fish of 5 pounds have been taken, and numerous young ones have been seen.

In carrying the fingerlings to Mystic Lake a can was jolted out of the wagon, the road being very rough, and fell in a pool a few feet from Bozeman creek. The fish were scooped up and placed in the creek, where they have multiplied, furnishing good fishing. This accidental planting was alluded to by Mr. Choate, our Ambassador to Great Britain, at an annual dinner of the London Fly Fishers' Club, at which he presided.

It has been supposed that steelhead trout would thrive only in deep waters, but both Bridger and Bozeman creeks are small mountain streams, quite shallow most of the year, and when these fish reach 3 pounds in such waters in six or seven years, it is pretty good evidence that they will thrive in waters suitable to others of the trout species; moreover, they live in perfect amity with them. In Bridger creek, a rocky and swift stream, there are the native red-throat trout,

brook trout, steelhead trout and grayling, and each species is holding its own.

Red-Throat Trout.

I weighed a red-throat, or native trout (*Salmo clarkii*), which was 3 pounds, good weight, when dressed. It was two years old, and was one of a lot sent by the Commissioner to a party near Toston, Mont. There were no fish but German carp in the pond before the trout were planted, and their rapid growth was no doubt the result of feeding on young carp. The owner of the pond assured me that there were still larger trout in the pond than the one sent me. Some native fry were placed in a new pond, which was made, however, in a swamp fed by springs and contained an abundance of food. Two fish from the pond were weighed at two years of age and were 2½ pounds each. I might multiply instances, but forbear.

Grayling.

I have heard from plantings of grayling in streams in which they did not exist before, in several Western States, and the reports have been uniformly favorable. As the U. S. Bureau of Fisheries has shipped millions of eggs from Bozeman stations to its Eastern stations and to State fish commissions, it is hoped that this beautiful game fish may find a suitable and congenial home in Eastern trout streams. It lives in perfect accord with the native trout, also the Eastern brook trout, in this State. I have taken them up to 2 pounds on the fly, in the upper Madison, but five or six miles from the Yellowstone Park, also a few miles below in the upper canyon of the river, and in Beaver creek, a tributary in the canyon. These grayling are gamier than the trout, and leap several times from the water when hooked. Flies should be smaller than the usual trout fly, on No. 12 hooks. I have found the professor, Henshall, coachman and black-gnat, all good flies, especially if tied with split wings and a red tag of worsted for tail; the gray and black hackles are as good.

The grayling is found in the Madison and a few tributaries in Yellowstone Park, but I do not think it goes above the confluence of Gibbon and Firehole rivers, owing to their high temperature consequent on the hot water from the geysers.

JAMES A. HENSHALL,
U. S. Bureau of Fisheries.

BOZEMAN, MONT.

Fish and Fishing.

A Boy and a Maskinonge.

WHILE attending a fish and game protection meeting the other day in the office of Mr. F. L. Wanklyn, manager of the Montreal Street Railway, my attention was at once attracted by the beautifully mounted head of a maskinonge. The enormous mouth of the monster is wide open, showing the tremendous capacity of its throat in life and its large, sharp teeth. The fish to which this head belonged, weighed 37 pounds several hours after it had been caught, and when it had already lost a good pound or two of blood, due to the fact that it had been found necessary to gaff it a second time. Several larger maskinonge have been captured in the St. Lawrence waters, but none so large as this, I fancy, by so young an angler. It was hooked by a fourteen-year-old son of Mr. Wanklyn, on the 27th of last August, near Isle Perrot. Young Wanklyn was trolling for maskinonge from a boat in which were also his father and sister. His bait was a perch nearly a pound in weight, the dorsal fin of which, with its sharp rays or spikes, had no terrors for the huge-throated fish which gorged himself with it and became impaled upon the hook. It may well be imagined that the boy had a swift time for half an hour or so with his new connection. When it was first found possible to bring the fish close up to the boat, Mr. Wanklyn struck at it with the gaff and impaled it at the first attempt. Its weight was such, however, that the effort to lift the fish into the boat tore the gaff out of its body, and a stream of blood marked its course as it writhed in the water, lashing it into foam and then placing a considerable distance between itself and the boat. It was not very long before it was again brought to the side of the boat, and the gaff having a better hold in the body of the fish this time, it was safely, though not without considerable difficulty, lifted over the stern into the boat. Even then it was not killed without considerable difficulty and some danger of upsetting the boat. The head of a maskinonge, when well mounted, as this one certainly is, makes a very handsome trophy.

The Philology of the Maskinonge.

Next to the ouananiche, there is, perhaps, no other American fish respecting the name of which there is so much confusion, as the maskinonge. Dr. Henshall's praiseworthy effort to secure uniformity in the spelling of this fish's name, has met with no success, doubtless because he advanced no justification for the orthography proposed by him. He claims, erroneously, I believe, that by common consent and custom, the name is "muscalonge" among the majority of anglers, and that "mascalonge" it will be for generations to come. As a matter of curiosity, I have just turned over the pages of all the numbers of FOREST AND STREAM for the last two months to see how far this estimate is correct. In the numbers which I examined, the name of this fish is printed at least half a dozen times. Yet not once does it appear in the form which Dr. Henshall claims to have been adopted by the majority of anglers. I find it printed "muscalonge" two or three times. It has also appeared as "muscalunge," "muscallonge" and "maskinonge." Other forms of the word are "muskallonge" and "muskellunge," the latter being the name employed to designate the species by Dr. C. Brown Goode, in his "American Fishes." Still another form of the word—"muskallunge"—is employed by Messrs. Jordan and Evermann, in their catalogue of the fishes of North America. Neither this form, nor yet "mascalonge," which is favored by Dr. Henshall, is the most commonly accepted orthography. The forms of the

word which appear to me to be of most common use and acceptance, are "muscalonge" and "maskinonge." For the use of "muscalonge" I know of neither reason nor important authority. The original spelling of the Indian name by the early French settlers in America was undoubtedly "maskinonge," and such it is still called in the statutes of Canada. According to the late Bishop Lafleche, of Three Rivers, a recognized authority upon Indian customs and dialects, and early in life a devoted missionary to the Northwest, "makinonge" is derived from *mashk* (deformed) and *kinonge* (a pike), and was applied to the *Esox nobilior* by the Indians, because it appeared to them a deformed or different kind of pike from that to which they had been accustomed. The river of the same name which flows into Lake St. Peter, which name has been extended to the town built at its mouth, and the county of which it is the *chef lieu*, was doubtless so-called from the number of these fish taken in or near its estuary, and after their Indian name. And it is a singular corroboration of the absolute correctness of the French orthography "makinonge," that the very best authorities on the scientific classification of North American fish, including De Kay, Mitchell, Jordan and Evermann and Dr. Henshall, have substituted for the earlier name—*nobilior*—of this particular species, that of *masquinongy*, which is about as near as it is possible for English orthography to go in representing the correct pronunciation of maskinonge. Jordan and Evermann quote H. W. Henshaw as giving exactly the same derivation of maskinonge as Bishop Lafleche, and the late Fred Mather gave similar testimony. Here, then, we have a form of the name of this fish, for which there is a good reason to give, namely, that of priority and intelligent derivation, while it is also the most common form of the name in the country in which it originated, and one of the simplest to write and to pronounce from the written word. Is it not therefore advisable to endeavor to secure uniformity for the orthography "maskinonge?"

The Fishes of Hudson Bay.

The Canadian exploring expedition which is wintering in Hudson Bay on board the steamer Neptune, is likely to bring back with it very important information concerning the fishes of Hudson Bay, since an ichthyologist from the Department of Fisheries at Ottawa accompanies the expedition. It is known already that of edible fishes in those waters there are at least thirty species, but it is expected that there are many more. The cod, the common salmon, sea trout, speckled and gray trout, halibut, whitefish, herring, capelin, eels, whiting, jackfish, pickerel, pike, perch, sturgeon and others are found there. That most beautiful of fishes, Back's grayling, is common in some of the streams on the western side of the bay. Newfoundlanders now go regularly to Ungava Inlet, its eastern arm, after cod, each summer, while the same fish are also taken regularly at Fort George on James Bay, the southern projection of the great basin. It is clear, therefore, that these northern waters teem with fish life of the first commercial importance, and as many of the Atlantic areas now regularly fished are becoming more or less depleted, fishermen are turning their attention more and more to Hudson Bay as a reserve. It is only within the last few years that the bay has been much frequented by Newfoundland fishermen, but American whalers have visited it for a very long time past.

Porpoises are found in great numbers in the bay, which is also the mating place of the hair seals, which are killed in such thousands every spring off the Newfoundland coasts. During their presence in the bay, large quantities of them are secured by the Eskimos and Indians of the far North.

An Old Fish and Game Protective Association.

The Province of Quebec Fish and Game Protective Association, of which Mr. Wanklyn, of Montreal, is the president, claims to be the oldest organization of the kind upon the Continent. It was organized on Feb. 23, 1859. One other kindred organization dates back to 1844, but this is a game protective association only; namely the New York Association for the Protection of Game, of which Mr. Robert B. Roosevelt is the president. The oldest organization for the protection of both fish and game, in the United States, which appears in the list of such societies in the year book of the Department of Agriculture, is the New York State Fish, Game and Forest League, organized in 1865, and of which Mr. Robert B. Lawrence, of New York City, is the president.

E. T. D. CHAMBERS.

Consumption of Fish in Germany.

SIMON W. HANAUER, Deputy Consul-General, Frankfurt, Germany, reports: The inhibitory measures in Germany against the importation of foreign cattle and meat products have greatly advanced the price of meat in the country, causing a considerable reduction in the consumption thereof, as the middle and working classes cannot afford to pay the high prices demanded. In consequence of this, the consumption of fresh, dried, and salted fish has largely increased. A Hamburg fishing company has sent one of its cold-storage steamers to eastern Siberia to take in a cargo of salmon. Another Hamburg company has opened a depot and packing houses at Matarieh-Menzaleh, Egypt, for the curing and shipping of eels caught in the Nile and affluents, which are brought to Hamburg by way of Trieste. In German cities and towns the increased consumption of fish is making itself perceptible by the new additions of shops dealing in fish. Formerly, fishmongers were few in number, their custom only being among the rich and the first-class hotels.

One of the famous white oaks of New Jersey stands in the Presbyterian churchyard at Basking Ridge. It measures fourteen feet four inches in circumference at five feet high, while the branches shade a circle 115 feet in diameter.

All communications for Forest and Stream must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

In New England.

BOSTON, Dec. 5.—*Editor Forest and Stream:* A few days ago the South Shore gunners turned their attention chiefly from coot on the beaches to black ducks on the rivers and marshes, where they appeared in large numbers. Duck shooting is expected to be good for several weeks, and it may be said that a few yellowlegs and brant are yet to be obtained on the beaches.

Green Harbor River just above the old dyke is still a place of resort for ducks, as it was way back in the '40s, when "The God-like Daniel" used to row out from the backyard of his Marshfield estate into the midst of these duck feeding grounds. Local tradition, while admitting that Webster was the man who made brant and coot shooting popular at Brant Rock, claims that he was by no means the first man to shoot duck in Green Harbor River.

The abundance of foxes in the Marshfield Hills section of late has led the South Shore Fox Hunters' Association to lay out as the route for its next hunt the northern part of the town instead of that usually followed at the Plains. Mr. Calvin Ewell has recently captured a couple of Reynards on Tilden's Island.

A vigorous effort is being made by deputy Stackhouse and other wardens to stop the use of ferrets which has been going on in Marshfield and other near-by towns. A new claimant for horsewoman's honors was brought to the front Thanksgiving Day at the run of the Middlesex Hunt Club, namely, Mrs. Grafton St. Loe Abbott, to whom the brush was awarded as the first lady up. The fox was killed in the pasture of Mr. William A. Blodgett, and following the chase a breakfast was served at Mr. Blodgett's home with a large attendance. Among the many well-known leaders in the club are Mr. A. Henry Higginson and Howard Snelling. Mrs. Abbott is the daughter of Hon. Charles Francis Adams, and resides in Concord, Mass.

A Diana in Vermont.

According to a report from Barnard, the only woman who has shot a deer in the State this season is Miss Kate Reagan, of that place. The young lady is, so to speak, her widowed mother's "right hand man" in carrying on the farm as well as an accomplished musician and an artist. Instead of Horace Greeley's advice, I would suggest, "Go to Vermont, young man."

A Claremont, N. H., hunter has recently secured a trophy very rarely obtained in that part of the State, it being a large Canada lynx that measured 33 inches from tip to tip and weighed 29 pounds.

From Bangor the shipments of deer for the last week are reported to have been 273 deer, 18 moose; last year for the corresponding week, 306 deer, 7 moose; total of deer for the season, 4,084; 206 moose; while last year they were 4,765 deer, 189 moose.

Commissioner Carleton reports the amount of money received for licenses is \$26,650. It is claimed the law has had the effect to deter illegal shipments of game out of the State, comparatively few seizures having been made. Comparing figures above given, it will be seen that while more moose have been shipped this year than last; the number of deer to the present time is 681 less than last year.

Your correspondent had thought the day of the side hunt had gone by, but it seems one has been held recently at Roque Bluff, in Washington county, Maine. Whether it was conducted otherwise than on the same old plan of killing everything for a count, I do not know. It is time this relic of the "dark ages" of sport should be prohibited for all time to come.

On the first day of the close season a huge bull moose turned the tables on an employee of the Maine Central, who had secured two good bucks near Danforth. As he could not shoot the moose, he took to a tree, where he was forced to remain for an hour or so, when the animal walked away.

Dr. Heber Bishop returned early in the week from his private camp beyond the chain of ponds in the Moose River valley. He and his party brought out their quota of deer. Mr. Frank R. Whitcher, of Amesbury, and his wife, have recently returned from Deer Farm, where they have spent several weeks with a party of friends.

Mr. C. W. Brown, of Salem, has just brought out two deer and a moose from Rainbow Lake, near Millinocket, having been in camp less than five days. Mr. W. S. Hinman had as his guests at the Runaway Club, Clearwater, Thanksgiving week, President Reed and Dr. E. W. Branigan. CENTRAL.

Fishing in Erie Harbor.

ERIE, Pa.—*Editor Forest and Stream:* I know of no single place on the chain of lakes that gives better returns to the hook and line fisherman than Erie harbor, and the reefs outside of it, so long as the nets are kept out. A few years ago the hook and line fishing was nearly destroyed by illegal netters, most of them being foreigners; but about that time a man, who is an enthusiastic fisherman himself, was made chief of police and exerted himself to stop the netting, and did stop it. Since then but little has been done. Lately a number of gentlemen have begun a movement that is calculated to stop what little netting is still being carried on. They propose to form an association and appoint a number of officers to watch for the poachers. I think there is little poaching done now, but they should know. They complain that the fish warden does not try to stop it. The way to stop it is to do the work themselves, if they know of any netting being done. The warden cannot be expected to camp down on some dock day and night watching the poachers; and they know him and know at least enough not to be caught netting while he is around. Some of us who are not fish wardens would stand a far better show when it comes to catching them than he would. What is wanted is far each man who knows of any of these nets being set to report them; let him be fish warden at the moment. I do not care about these fish myself, for I never do any fishing, but I will have any one I see netting the fish taken in in short order.

In spite of the netting, if any of it is being done, I have seen some big strings of fish taken with a hook

and line this summer. Hardly anyone who fishes for a few hours fails to land about all the fish he can carry.

There is a great deal of fishing in winter time through the ice, and nets are used at times then. It ought to be an easy matter to stop that. There need be no trouble in finding and destroying the nets. Some were destroyed last winter.

Years ago a great many people came here every summer for an outing and to fish. When the fishing was spoiled they quit coming, but during the past few years they would have found all the fishing they wanted had they come after it. CABIA BLANCO.

Sea Bass at Seabreeze.

SEABREEZE, Fla., Nov. 23.—I am mailing you to-day picture of catch of sea bass made off the Clarendon Inn pier, Seabreeze, Fla., on Nov. 16, by three men; namely, Mr. Jasper Owen, of Philadelphia; Mr. S. A. Boyd, of New York City, and Manager Knappe, of the Clarendon Inn, Seabreeze, Fla., in a little over three hours, with rod and reel, rods from 10 to 14 ounces. Lines used were 18 thread Cutty Hunk. Fish weighed from 14 to 30 pounds each, and aggregated 924 pounds.

This is the largest catch of sea bass recorded on the east coast of Florida by three men with rod and reel in anything like the same space of time.

I wish to remark that none of the fish of this enormous catch were wasted, as all of them were used by workmen, who are employed on the Clarendon Inn extension, which is in process of erection.

E. L. POTTER.

The Kennel.

Points and Flushes.

At New Haven, Ky., Dec. 4, the annual meeting of the National Fox Hunters' Association, two important matters were decided, namely, the election of officers for the ensuing year and awarding of the gold cup in the all-aged event. W. Wade, of Pittsburg, was elected president, and R. J. Fink, of Louisville, secretary and treasurer. Among the directors elected are Lee, of Alabama, and Ormsby, of Virginia. Cricket, owned by R. J. Fink, won the gold cup as the champion of the all-aged division. A committee will be appointed by the president to fix the time and place for the next meeting.

Yachting.

Designing Competition.

\$225 in Prizes.

Two designing competitions have been given in FOREST AND STREAM. The first was for a 25ft. water-line cruiser; the second was for a 15ft. one-design class. Both competitions were very successful. The great interest taken in those competitions has prompted us to give a third one, open to amateurs and professionals. The prizes which will be given are as follows:

First prize—\$100.

Second prize—\$60.

Third prize—\$40.

Fourth prize—\$25, offered by Mr. Theodore Zerega for the best interior plan.

The designs are for a yacht conforming to the following conditions:

I. Centerboard cruiser, 40ft. l. w. l.

II. Boat must not draw over 6ft with centerboard up.

III. The lowest freeboard to covering board must be 3ft.

The design must be modern in every particular, without containing any extreme or abnormal features. The conditions have been made as simple as possible, that competitors might have all latitude and scope in working out their ideas. We wish to produce an able and comfortable cruising boat, one that shall have ample accommodation for two or three men living aboard for a period of several months, and one that can be easily managed at all times by two or three paid hands. The draft is restricted to 6ft. in order that the boat may have access to nearly all the desirable harbors, and may, thereby, widely increase her cruising field.

Drawings Required.

I. Sheer plan, scale $\frac{3}{4}$ in.=1ft.—showing center of buoyancy, center of lateral resistance and center of effort of both rigs.

II. Half breadth, scale $\frac{3}{4}$ in.=1ft.

III. Body plan, scale $\frac{3}{4}$ in.=1ft.

IV. Cabin plan, inboard profile and at least one cross section, scale $\frac{3}{4}$ in.=1ft.

V. Two sail plans, scale $\frac{1}{4}$ in.=1ft.; one as a yawl; one as a pole mast sloop.

In the case of the yawl rig the position and height of the mast and length of gaff are to be the same as in the cutter rig. Plans must show working topsail and size of light sails.

VI. All ballast outside on keel except amount necessary for trimming.

An outline specification must accompany each design. The drawings should be carefully made and lettered. All drawings should be on white paper or

tracing cloth in black ink. No colored inks or pigments should be used. The designs must bear a nom-de-plume only, and no indication must be given of the author. In a sealed envelope, however, the designer must inclose his own name and address, together with his nom-de-plume. All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, not later than March 1, 1904. All drawings will be returned, but postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all of the designs.

Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, who passed upon the designs submitted for the 25ft. with great care, has again consented to judge the designs and make the awards.

Emperor William has withdrawn his offer of a cup for an international ocean yacht race in 1904 on account of his being in poor health, but he will put up a trophy for a transatlantic race in 1905.

Commodore Robert E. Tod, of the Atlantic Y. C., received the following cable from the Kaiser on Nov. 28: Owing to his Imperial Majesty's protracted convalescence, he has been prevented seeing his yachting representatives at date intended to fix details for Atlantic cup race, thus time for designers and builders of new yachts now far too advanced to get fresh boats ready for such competition this coming season, spring 1904. His Majesty, therefore, deems advisable postpone his offer for race until 1905, and will send full details for this offer in autumn, 1904. His Imperial Majesty therefore withdraws offer cup for 1904, and hopes his proposal will meet approval of both clubs.

Cruising Competition Awards.

NEW YORK, Dec. 1.—*Editor Forest and Stream:* I have read the twenty stories submitted in the cruising contest of 1903, and I must say that the work has been a pleasure rather than a task, most of them taking me over the cruising grounds with which I am familiar, others telling of distant waters not yet visited.

I congratulate FOREST AND STREAM upon having interested so many contestants, especially some of the gentler sex. More than one story is submitted by ladies cruising with the men of their families. While their accounts are most entertaining, they lack to a certain extent the sailor-like roughness of telling that technical logs possess.

When the ladies become captains and command their own vessels, then the other sex will needs look to their laurels.

It has not been an easy matter to award these prizes, as the stories are, without exception, most interesting, and I note with great pleasure that FOREST AND STREAM's admonition about the use of nautical slang has been very carefully observed. Hard as it has been to award the first and second prize, it was still harder to award the third, and I could have awarded at least three fourth prizes, had they been provided. The same system of marking has been used this time as last, with 10 high mark for each of the following: Seamanship, Pilotage, Diction, Interests, Chart, Photographs, and the totals carried out; 60 is the possible score.

Hull to Bristol, W. Lambert Barnard, of Boston, Mass., wins first prize with a score of 48. Yacht Cruise of Mblem, Geo. E. Darling, of Providence, R. I., wins second prize, with a score of 39. In Southern Seas, Allan Dunn, of Honolulu, Territory of Hawaii, wins third prize, with a score of 37.

If FOREST AND STREAM offers another cruising competition, I suggest that at least three fourth prizes be given.

From the wording of the offer of prizes this time, I have considered that the charts submitted to gain a high mark should be the work of the contestant. Government charts have not been marked very high. Pilotage, of which FOREST AND STREAM makes a special note in Rule III, has been in many cases neglected, and one might say with "Disco Troup," "What's come to your lead? Et it?"

In Hull to Bristol, the winner of first prize, Mr. Barnard, has made his story somewhat longer than necessary, but he has a splendid one to tell, and tells it like the sailor man he is. His use of oil to smooth the sea off Chatham, and his care of his boat when anchored off Hyannis that bad night, have won him some high numbers. I believe his Charity Cruise won third prize in a previous competition, and I beg to offer my congratulations upon the improved work. He also sent some excellent pen and ink sketches of Ayaya which I hope you will publish, but they were not in the competition.

Yachting Cruise of Mblem, second prize, very carefully done, a long and plucky cruise for cruisers on a catboat, and the chart very well made. Mblem entered at least two unusual harbors, Cape Small Point and Chatham. A description of these harbors and pilotage notes on them would have been of great interest, and we regret that Mr. Darling omitted them.

The Ayaya and Mblem were anchored not more than a few miles apart on the bad night of Saturday, July 18. One near Hyannis and the other near Cross Rip Light vessel.

In Southern Seas, third prize, the seamanship is excellent, and the interest perfect, opening a new cruising ground to your readers, who can feel themselves fairly launched on a Pacific cruise, the dream of all yachtsmen.

The Maiden Cruise of Istar, by B. Hughes Wells, for which I wish there was a prize, takes us interestingly over some familiar and some new water. The poem at starting is happily chosen, as Dr. Wells has certainly "dared the farthest main" in more than one small cruiser. Excellent photographs accompany this story. I wish the Doctor had told us about Cape Porpoise Harbor, recently dredged to 15ft., of which I have not

been able to find a chart other than that issued by United States engineers.

A Canoe Yacht on Lake Ontario, by J. Edward Maybee, is prefaced by some very pertinent remarks on the hard task that a cruiser has to make himself interesting when aboard of a well-found little ship. His story does not prove his case, however, as Lorna's cruise is interesting from cover to cover. Mr. Maybee is a student of human nature as well as a sailor, and his words on the frying pan and on whiskey must not be overlooked.

Cruise of the Nerine, S. G. Etherington, New Rochelle to Marblehead and return, is carefully done with very good photographs, and no end of work in making a good chart. The story is very interesting; but unfortunately little attention is paid to pilotage.

In A Vacation Cruise, William Kuhnle, a graduate of the schoolship St. Mary's, we are shown the benefits of a practical education in seamanship. Mr. Kuhnle gives a very good description of his boat and of the use of the lead. Tells the character of the bottom by it, which he is careful to find out before anchoring. Takes cross bearings of his anchorage for purposes which he explains. The schoolship St. Mary's is a New York City public school afloat. She is commanded by an officer of the navy, and usually makes a summer voyage to Europe. Mr. Kuhnle proves that the students are well grounded in navigation and seamanship. The few photographs sent are not very good.

Cruise of the Tainui 1903, Jas. W. Commeford, Jr., is a plucky one, as the boat is small for the bad weather encountered on the Great Lakes. The seamanship is fair, the pilotage not up to the mark; a good number of photographs are sent which will interest readers. Tainui was in the last competition, and her cruise gained first prize.

A Cruise on Long Island Sound, by C. N. Robinson, is prefaced by a very interesting description of Ramea, whose owner is evidently very fond of her and justly so. The seamanship and pilotage column show good marks, but the chart has no course marked on it. The photographs are good and excellent descriptions are given of the anchorages.

The Indra Log, Henry Picterny, takes us from Marblehead to Sydney, Cape Breton, over most interesting waters. It is very well written by a man who, with too much modesty, calls himself a landsman. The preliminary remarks are specially good and the descriptions of the boat excellent. The interest is maintained throughout, and I am sure your readers will regret that Mr. Picterny did not make the whole cruise with Indra.

In the Cruise of the Whitecap, Louis S. Tieman takes us in an auxiliary from New Rochelle to Cottage City and return. His descriptions of harbors are very good, particularly that of Cuttyhunk. Many owners of shoal boats will be glad to know that they can depend on getting into the pond when anchoring in Cuttyhunk Harbor is too impossible. Has it ever been decided in boats with power, which is the auxiliary, the sails or the engine? No photographs with this story.

William P. Morrison sends Bantam's Cruise, and gives an excellent description of getting underweigh. His chart might have had the course of Bantam jotted on it, as among the Maine islands it is hard to follow a boat without this aid. His remarks on rights of way between large and small vessels should be read by all, particularly by those of your subscribers who have to do with admiralty courts.

Co-education on a Yawl is sent by Mrs. Lucius W. Hitchcock, and shows that the ladies are taking more and more pleasure in yachting each season. The interest is maintained throughout, and some excellent photographs are sent. The combination of captain and skipper on one boat has aided to defeat more than one America's Cup challenger, and we congratulate the crew of the yawl that it worked them no harm.

The story sent by Mrs. Alfred V. Sayre is one showing a lot of pluck and is interesting. Good photographs accompany this cruise.

Cruising in Nova Scotia Waters, by Samuel T. Allen, is presented without a chart, which is unfortunate, as southern Nova Scotia must be a very charming place to make a cruise, and next to that to follow a cruise on the chart. Mr. Allen gives a very good description of his boat, and tells of frequent use of the lead. His closing remarks about the coast are both interesting and instructive.

W. G. Bodamer, of Buffalo, tells a good story in a new cruiser, and describes his boat well. The chart presented is very good.

In A Little Cruise in a Little Boat, by G. F. Maurice, Mr. Maurice presents a very interesting story of how he came into possession of his "little boat," and gives an excellent description of her. He speaks of her as if she were a dear friend. His list of articles necessary for such a cruise are specially good.

A Day or Two at Sea, is a cruise on Lake Ontario, sent by Charles Stanton. He does not tell us very much about the craft that he made this cruise in and omits photographs.

Reginald Mack sends The Cruise of the Minota, taken on Lake Michigan, and is a very good account of yachting on those waters. The pilotage notes are admirable, and the photographs sent are an excellent lot. Minota is a celebrated boat, and it must be a great pleasure to sail her.

The Captain's Yarn, by F. Chester, is well gotten up and the chart a very good one. Your readers will certainly enjoy this cruise from Philadelphia to Plymouth, Mass., and return.

THEODRE C. ZEREGA.

Mr. Norman L. Skene has severed his connection with Messrs. Burgess and Packard, and has associated himself with Mr. Hollis Burgess. Mr. Skene will take charge of the designing department of Mr. Burgess' business, and he will give great care to the design and construction of all classes of yacht and mercantile work. Mr. Skene is a graduate of the Massachusetts Institute of Technology, and he is also secretary of the Chatham Y. C.

Notes on Yacht Measurement.

Editor Forest and Stream:

I have read the communication of Professor Poor in your issue of Nov. 21 with considerable interest. His contention that exact and scientific methods should be introduced into measurement rules is one which should commend itself to acceptance wherever and whenever practicable, and the form of his argument is, I think, not without value in this respect. Unfortunately, apart from Froude's law of corresponding speeds, there is, so far as I have seen, very little that has been given exact form and value, which is applicable to the purpose; and even the law of corresponding speeds seems to have only a somewhat inaccurate bearing. We are left to apply the results of observation and experience, to obtain as much fairness, and as good conditions in racing as are found practicable, and assuredly clubs have not moved in the direction of improvement with the speed that observed facts would seem to require.

I think, however, that Mr. Poor is under a false impression in supposing that "the assumption in all measurement rules that speed is proportional to the fourth root of sail area," has governed the charge for it. It also is not wholly true, but only conditionally so, that "the amount of motive power (in a yacht) varies with the sail area." A full examination of this matter would require much to be written, but it may suffice to state that sail area is not power, it is one and only one of the mediums through which power is exerted or conveyed and made effective for propulsion, and the power obtained through the agency of sails is not a constant quantity; it differs widely from that of a steam engine. In a light wind the larger sail plan has an advantage, but as the wind increases this diminishes, and when, of two yachts racing, the wind strength equals the needs of the one with smaller rig, the other is disadvantaged by her larger spars, higher center of effort, and greater weight aloft; and if she has to be reefed she suffers the further disadvantage of allowing time for sail which is not in use, and which is doing harm to her. Sail area cannot be said to have, in any practical sense, a constant value, any average value that it may have for racing purposes depends on local conditions and prevailing wind forces. Its value and appreciation here is greater than in British waters, and in both places it probably has a much greater value than it would have in Bermudian waters in the spring months.

I saw an illustration of this a year or two ago. A well-known New York yachtsman had a small American yacht at Hamilton, she had a fairly large rig, which counted in her measurement, and raced many times against an English boat of smaller rig. The American boat usually was reefed, and was beaten by a large allowance, which had to be made on sail she could not use.

There are matters which concern the equities of racing of which Mr. Poor makes no mention, and these, perhaps, have not had his attention, though they affect the relation of sail in the yachts M. and E., and its propulsive effect in those vessels. M. had, in 1902, and before the reduction of her sail plan, 81 square feet more sail than E., but with this one-thirtieth more sail than E., and with a shorter waterline by 21 in., this sail had to drive a body of over 4 ft. larger area of submerged MS., and of over one and a half tons greater displacement, and this not necessarily with any more stability to make the sail carried effective than that possessed by E., since E. made up by draft (leverage) for that which, relatively, she lacked in displacement. The notable thing about this is that as between M. and E. the only rule in use in 1903 in these waters, which made any allowance from E. to M. for the different relation of their MS to dimensions, was that of the Larchmont and the Seawanhaka-Corinthian Y. C. The allowance factor was 1.32. The rule of the Y. R. A. of Long Island Sound had ceased to make allowances to less extreme forms than that of E. In other words, the altered rule failed to make allowance to a MS of approximately compact form.

JOHN HYSLOP.

Editor Forest and Stream:

I have made a careful study of Dr. Poor's article in your issue of Nov. 21, not only because the subject always interests me, but because it is so seldom that we are favored with the views of a practical yachtsman. For this reason I do not want to offer ungracious criticism, but one of his suggestions is so revolutionary that it is fairly open to discussion. He states that the assumption that speed is proportional to the fourth root of sail area does not seem to be founded on any substantial basis, and after elaborating the question, concludes that speed is more nearly proportional to the square root of sail area. His evidence in support of this theory consists of: 1. The accepted rule in power boat practice that for moderate speeds the power will be nearly proportional to the square of the speed. 2. The results of two seasons' racing between two yachts, the sail of one being reduced for the second season. It is admitted, however, that these results cannot be regarded as conclusive. It is obvious that to secure reliable data the experiment should be tried with successive reductions or increases of sail, as Dr. Poor suggests it would be better done with a one-design class of boats. Aside from this it does not appear that the two boats were well matched. Even in 1902 there was an average difference of 26 miles per hour in their racing speed, and the boat M. was apparently beaten steadily and conclusively by the boat E. Next year M. reduced canvas 4 per cent. (the reason for which is not stated), and was beaten over half a mile an hour on the average. Evidently M. was not a fair match for E., at all events in 1903, and some other causes beyond sail area must have been responsible for the results noted. At the same time Dr. Poor is entitled to credit for taking the trouble to average the observed data, and it would be well if more yachtsmen were on the lookout for such evidence.

Coming now to the first proposition, that in power

boats speed varies as the square root of the power, Dr. Poor says that in sailing vessels the power developed is proportional to the area of the sails, and on this basis compares it with the horse-power of an engine. But the two sorts of power, as here expressed, are not similar. The horse-power of an engine (properly calculated) is a definite force, ready for use. Sail area will develop or, let us say, transient power, when acted on by wind pressure, which is highly variable in itself, and its action on sails is by no means thoroughly understood. With a given sail area and a given wind pressure, the driving power developed will obviously vary with the horizontal and vertical angles of the sails. This alone renders difficult any direct comparison with engine power, and to apply the rules of one to the practice of the other, is not justifiable. Furthermore, it is quite possible to increase the driving power of a steamer without in any way altering her trim. Practically nothing of the sort can be done with a racing yacht, except by working backward and reducing sail, an experiment that would scarcely pay in actual racing, assuming that the boat could carry her sail effectively in the first place. To take a common example, suppose a steamer of 50 ft. waterline is regularly driven at 8 knots and is intended to maintain that speed steadily without forcing either engine or boiler. It would not be unusual in such a case to have an engine and boiler capable of driving the boat at 10 knots if required. The power developed would therefore vary, according to the rule, as the squares of 8 and 10 or as 64 and 100.

That is, for a 25 per cent. increase of speed, there would be an increase of over 56 per cent. in driving power. Now take a 50 ft. waterline sailing craft, moderately canvassed, and capable of doing 8 knots in a fresh, reaching breeze, would any one propose to drive her at 10 knots by increasing the sail area 56 per cent. without any alterations to the hull? Certainly not, and for a reason apparent to any sailor that the boat would not carry the added sail. With shifting ballast the thing might be done, but not otherwise. A great increase of beam and draft might enable the yacht to increase her rig 56 per cent., but there would be added resistance due to the alterations of form, and the result would be problematical. A comparison of yachts of various sizes, but similar form, shows that sail area varies pretty much as the square of the length, or in another form:

$$VS = L \times \text{constant.}$$

And the constant will vary from 1 to 1.5, according to the type of yacht and the amount of sail that may be carried under the local conditions of wind and water. This formula is really the basis of the old length and sail area rule, VS being used only as a qualifying factor in connection with L . There is no relation between sail area and speed, except in connection with length, and the latter is always the governing factor.

Finally, I must refer again to the yacht M. used by Dr. Poor as an example, and according to his own figures her average speed over racing courses in good breezes was some seven miles an hour, with 2,500 sq. ft. of sail. The square root of this is 50, while the square root of Reliance's sail area is officially given as 127.16. We might, therefore, expect Reliance to show an average speed of 17.78 miles, according to the theory advanced by Dr. Poor. Needless to say, Reliance never attained any such speed under any circumstances, her best speed in reaching being under 13 miles. The examples are, perhaps, extreme, but it may be worth noting that the fourth roots of the respective sail areas are roughly 7 and 11; the latter figure would be a high average speed for Reliance even over a triangular course. It is, therefore, quite evident that in practice we are unable to increase speed any faster than the fourth root of sail area.

WM. Q. PHILLIPS.

CLINTON, OHL., DEC. 2.

TORONTO, Canada, Dec. 4.—*Editor Forest and Stream:* I have read with much interest Mr. Poor's article on measurement and time allowance, and find I cannot agree with all his conclusions. I can perhaps best set out our points of disagreement by taking concrete examples.

1. Let us take the case of two old-fashioned lead mines, one 16 ft. on the waterline the other 25 ft.; in each case let the square root of the sail area equal the L.W.L.;

then in each case, by the rule $\frac{L.W.L. + \sqrt{S.A.}}{2}$ the racing

length is the same as the L.W.L. and also as the $\sqrt{S.A.}$. The possibilities of speed would be respectively as the $\sqrt{L.W.L.}$, that is, 4:5. But these numbers are also the fourth roots of the respective sail areas, therefore in the case of similar vessels it appears that the fourth roots of the sail areas may indicate their possibilities of speed with a considerable degree of accuracy. If, however, we take the case of two vessels of exactly the same size and shape, but one carrying more canvas than the other, then possibly Mr. Froude's rule would apply. But this is very seldom the case; the rule is that each vessel carries all she can with due regard to average wind and weather. If, then, one boat carries more sail than another of the same length, it usually means that the boat with the larger sail area has had her form altered to enable her to carry the excess of sail, and this change of form almost invariably detracts from the theoretical advantage due to her increased propelling power.

2. Now take the case of the old and new Cup defenders. A typical old boat would be 90 ft. L.W.L., 8,100 square feet canvas; a typical modern boat, 90 ft. L.W.L. and 15,625 square feet canvas. The square root of 8,100 is 90, of 15,625 is 125. Are the new boats faster than the old in any such proportion?

The fourth roots are respectively 9.4868 and 11.1803. Do not these numbers much more nearly express the relative speeds of the two types?

In steam by quadrupling your power you can double your speed in the same hull. With sail you cannot do this, because on a given length of hull you cannot pile up canvas without changing the form of your hull, and this means increased resistance to speed every time.

J. EDW. MAYBEE.

Chicago Y. C.

The annual meeting of the Chicago Y. C. was held on Nov. 24, and the following were elected to office: Com., Marshall D. Wilber, steam yacht Mercia; Vice-Com., Godfrey H. Atkin, sloop Minota; Rear-Com., W. L. Baum, sloop Colleen; Sec., Chas. E. Fox; Treas., Jas. P. Walker; Judge Advocate, N. W. Hacker; Fleet Surgeon, Raymond C. Turck; Trustees, William F. Cameron, John W. Edminson; Delegate L. M. Y. A., E. P. Warner; Delegate I. L. Y. A., George Lytton.

The club by-laws were changed to permit only yacht-owning members voting on strictly yachting questions.

Before the meeting adjourned a unanimous vote of thanks to the retiring commodore, Mr. C. H. Thorne, was passed. To Mr. Thorne is due a great deal of credit for the prosperity of the Chicago Y. C. and the position it has attained to-day as a yachting organization. It now has 462 resident members and 28 non-resident members, and the prospects for next season's yachting in this club seem particularly bright and encouraging.

The report of the commodore's committee on the new 30ft. class was adopted. Subscriptions for a new syndicate boat in this class was started and \$1,000 subscribed. It is expected that other boats will be built by the members by next spring, and that there will be plenty of good racing for the Centennial Cup, which it is proposed to put up for this class. It is probable that invitations will be extended to all clubs on the lake to compete for the cup. A committee of five was appointed to take charge of the cup subscription. The proposal that the club put up \$500 of the \$1,000 needed for the trophy was left to the club directors.

The report of the commodore's committee on the Fast Cruiser Class is splendidly gotten up, and gives an excellent idea of how thoroughly this body did their work. The committee was made up as follows: Dwight Lawrence, Chairman; E. P. Warner, S. P. Wells, Jr., W. H. Thompson and G. H. Atkin.

We publish in full the introduction and the report of the committee, which are as follows:

At the request of a number of members of the Chicago Y. C., Com. C. H. Thorne, in June, 1903, appointed a committee of five members to gather information and report as to the type and probable cost of the most suitable sailing yacht for Lake Michigan, and the instructions the committee received were embodied in the following letter sent to each member thereof on June 16:

Dear Sir: Several club members have suggested to me that a committee be appointed for the purpose of ascertaining the size, type, rig and probable cost of a sailing yacht most suitable for Lake Michigan.

Answering these suggestions, I am pleased to appoint the gentlemen named below, and request that after thorough investigation they report to me in writing on the following points:

First—The most suitable size for all purposes; generally known as a fast cruiser.

Second—Size; to include dimensions and cabin space.

Third—Type; to include construction—keel versus centerboard.

Fourth—Rig; to include spars, sails, shrouds, stays, etc.

Committee: Dwight Lawrence, Chairman; E. P. Warner, S. P. Wells, Jr., W. H. Thompson and G. H. Atkin.

Many of our members in the past have learned the game by investing in great bargains which have turned out to be "white elephants," and, as we now have many prospective yacht owners in the club, who are without the knowledge needed for purchasing or building, I hope that the report of this committee will be of such character that but little doubt can remain as to what is best.

The question of rules will, of course, be applied to the studies of the committee, but I trust that the rules will be made to fit the boat rather than the boat be made to fit the rules. The committee might also suggest a plan for creating an interest in the yacht selected.

It will give me great pleasure to have you accept this appointment. Very truly yours,

CHAS. H. THORNE, Commodore.

The committee met shortly after, and with Mr. Dwight Lawrence as chairman, and Mr. G. H. Atkin as secretary, commenced their investigations, the results of which are embodied in the following pages.

The committee desire that the nature of their work be clearly understood by members of this club, as it is their aim merely to lay before them for their information the designs received and the facts obtained.

The committee beg to extend their thanks for the prompt and courteous assistance rendered them by the following designers:

Messrs. Gardner and Cox, 1 Broadway, New York; Mr. B. B. Crowninshield, 131 State street, Boston; Mr. Morgan Barney, 29 Broadway, New York; Mr. C. D. Mower, 9 Murray street, New York; Mr. W. P. Stephens, Avenue A and Thirty-second street, Bayonne, N. J.; Messrs. Small Bros., 112 Water street, Boston.

The original drawings furnished by the above designers will be kept for a time on file by the secretary of this committee, and will be open to the inspection of any of our members who desire to look them over, after which they will be returned to the designers. The secretary's office is at 1425 Marquette Building.

Com. Chas. H. Thorne,

Chicago Y. C., Chicago.

Dear Sir: In compliance with the request contained in your letter of June 16, your committee have had numerous meetings, and as a result of their deliberations beg to submit the following report on the type of boat specified in your letter.

In considering the Fast Cruiser type, the following points were given careful thought and much discussion:

Cabin Accommodation. (a) For cruising purposes in Lake Michigan, where the yacht owner and his friends might be living on board for a number of weeks every summer, we felt that due attention should be paid to

the cabin and its accommodations and decided that there should be at least 5 to 6 ft. head room, berths for at least four in the cabin, suitable cooking space, room for the crew forward and toilet requisites.

Keel. (b) The weather conditions of Lake Michigan necessitate the building of a particularly staunch craft, with reasonable freeboard and moderate displacement. The consensus of opinion, therefore, was in favor of a beamy, well-ballasted keel or compromise boat, with a draft that would permit of its safe use in the harbors and waterways mostly frequented by our boats.

Cost. (c) The first cost of a suitable cruiser to come within the reach of men of moderate means ought to range from \$2,500 to \$4,000, and in determining the size and type of boat these figures were kept in mind.

Maintenance. (d) The cost of maintenance and upkeep was also given careful consideration, and the type selected is one which can be readily looked after by one professional sailor without additional help, which should keep down the annual cost of maintaining and operating such a boat, including the commissioning and laying-up expenses, to less than \$500.

Scantling. (e) The life of a suitable cruiser being dependent in a great measure upon its plan of construction and its material, it was advisable that great care should be given to the adoption of a sufficiently rigid scantling table that would preclude the building of a weak or unseaworthy boat, or one which would be short-lived for any other reason.

The tendency of the present day among the builders of yachts is undoubtedly in the direction of a fast, well-built cruising boat rather than that of a much faster but lightly constructed yacht which might have a meritorious but brief career as a racing boat and then be practically worthless as a cruiser. The boat chosen by your committee, we believe, will, with reasonable care, be good for twelve or fifteen years and keep its shape and speed.

Class. (f) In order that we could take up the question of designs with some of the prominent designers and boat builders of this country, it was necessary that we should select a class under which these boats could be built, more particularly (as will be seen farther on in this report) as it is the committee's hope that an attractive class will be developed and the boats take part in annual racing events to be shared by other yacht clubs located on the Great Lakes. Your committee looked into all the rules which have been adopted, both on the Great Lakes and in the East, and finally decided that the rules and scantling table which were adopted by the Yacht Racing Union of the Great Lakes after many months of research and preparation, would fit the case very well; and we recommend the 30ft. class under these rules; the scantling table which we have shown in the appendix to this report, is practically a copy of that of the Yacht Racing Union, the only additional restrictions to these rules which we have made being to insert a toilet room and limit the over all length of the boats to 50ft, thus making an additional bar against the building of a freak type of boat under this class. By some designers this restriction has not been considered necessary, but in order to save all question and to prevent a boat being built with an excessive overhang, which would diminish its usefulness as a cruiser, your committee felt that all the above points which would result in the most satisfactory fast cruiser are covered by the 30ft. class under the table of restrictions and table of scantling adopted by the Yacht Racing Union of the Great Lakes; the following is the table of restrictions:

Maximum L. O. A.	50ft.
Maximum L. W. L.	30ft.
Maximum draft	7ft.
Maximum sail area (square feet)	1,550
Minimum beam on L. W. L., keel type	9ft. 6in.
Minimum beam on L. W. L., centerboard type	10ft. 6in.
Minimum area of largest immersed vertical cross section*	22.25
Minimum freeboard, keel type	27in.
Minimum freeboard, centerboard type	26in.

Having chosen this class, the committee wrote for designs of boats coming within its restrictions, and in response to our request we have received the sketches which have been reproduced and form a part of this report.

A comparison of the different designs shows them to be all within the restrictions and to exhibit only such variations in proportion and general dimensions as might well suit the ideas of the different designers, and we are therefore encouraged in the belief that the adoption of this class by the Chicago Y. C. will tend toward the building up of a splendid type of a fast cruising boat.

Designers.—The designers who have so kindly helped us in this matter will be glad to elaborate their work for those who desire to build into the class, and their views regarding this 30ft. fast cruiser are expressed as follows: Gardner and Cox state:

"In this boat we have followed the Irondequoit largely. We would advise the rig shown, as it has many good features, being a particularly good heavy-weather rig. The boat is laid out to conveniently accommodate four persons, as shown, with full head-room—6ft. 2in.—in the cabin."

B. B. Crowninshield says:

"In my sketch I have attempted a boat with a good turn of speed; but, at the same time, in this boat you would be able to get a fair amount of accommodation. The cabin, as arranged, has three pipe berths and transoms which would sleep three, if necessary, making six in all; also one pipe berth forward."

"This, of course, is only a general suggestion of what might be done in a boat for this class, and would probably be altered in many details to suit the requirements of the owners."

"You will note that the head-room in the cabin is 5ft. 10in. under the beams amidships; this, of course, could be increased, but the effect would not be so pleasing from the outside, as it would necessitate a higher house. I have given the design long overhangs, as that is the type

*Sectional area of centerboard yachts to be measured exclusive of sectional area of centerboard when lowered.

which will produce the most speed under the waterline restriction, such as your rules have. A shorter overhang would probably produce a more desirable type of cruiser, although the speed would necessarily be less."

W. P. Stephens writes:

"I presume it is now too late for a design to be of any use, but I would like to call your attention to one which I made some time ago for one of your members, Mr. J. W. Keogh, and which he will no doubt show you. This design was made for the old 35ft. class, but by slightly enlarging the dimensions it will almost fit the various requirements of the new 30ft. class, and would show pretty closely the type of yacht which I would advise for this class. The design was intended to replace Mr. Keogh's little Spray (also designed by me), and would be, like her, a good sea boat, safe and comfortable, and fast in class racing."

"I think that your committee has done well in selecting the 30ft. class, as it will give a yacht of sufficient size and power to be safe on Lake Michigan, of pretty good accommodation, and the cost will be materially less than the 40-footer. * * *

"Such a boat should, from its model and construction, be certain of such a long life before being outbuilt as to make her worth her cost."

Morgan Barney says:

"The design conforms with the restriction of the Y. R. U., and would make a yacht suitable for occasional cruising, as well as day sailing and racing. The displacement and beam are sufficient to give stability with about ten thousand pounds of lead, notwithstanding the liberal sail plan."

"It has been my intention to submit to the members of your club a yacht suitable for all-around work in any sort of weather, fast, of stylish appearance, and devoid of scow and freak features. Although the extreme scow with the maximum sail, minimum cross section and long, flat overhangs might show more speed, it would be obtained at a sacrifice of very many desirable qualities."

C. D. Mower writes:

"In regard to the general features of design, rig, etc., I may say that I have in many ways followed the so-called 'Buzzard's Bay 30-footers' built by Herreshoff, as I consider those boats the best type of one-design cruising and racing 30-footers that have ever been turned out. My design complies with the restrictions of the Yacht Racing Union 30ft. class, and the specifications would be written in accordance with those restrictions. While I have aimed to produce a fast boat, I have by no means sacrificed good cruising qualities in my design, and the cabin is arranged to give four good berths, toilet room, galley and room for the two hanging berths forward."

Small Brothers write:

"In these boats we have endeavored to combine strength, good looks, stability, speed, accommodations and general handiness. * * * The little which we have seen of the lake winds and water convinces us that a moderate boat in all directions would be the most weatherly and desirable. In reference to the approximate cost of these boats, it is hard to tell, as there is such a wide difference in the estimates of various builders, their prices ranging from \$3,000 to \$4,000. We should say that the average cost of a well-built and well-finished boat would be about \$3,600."

Summary.—We give below a summary of the measurements of the various designs submitted:

	L.O.A.	L.W.L.	L.W.L. Beam.	Extra Beam.	Draft.	Least Freebd.	Sail area.	Cabin H'd room.
Gardner & Cox	49.3	30.0	10.0	10.7	6.11	2.2	1525	5.10
Crowninshield	50	29.9	11.1	11.7	6.11	2.5	1550	6.11
Small Bros., keel	49	30	10	12.2	6.11	2.4	1550	6.0
Small Bros., C.B.	50	30	12.2	12.10	5.00*	2.4	1482	6.4
Morgan Barney	49.8	30	10.9	11.0	6.10	2.7	1550	6.0
C. D. Mower	46	29.6	10.0	10.6	7.00	2.4	1550	...

*With board up.

Annual Challenge Cup.—Your committee think that interest in this class will be aroused and maintained if the Chicago Y. C. arrange for a handsome silver trophy to be known as the "Centennial Challenge Cup," in commemoration of Chicago's recent celebration, the value of the cup not to be less than a thousand dollars; and paid for in the following manner: Five hundred dollars to be appropriated by the club and five hundred dollars to be obtained by voluntary subscriptions from members of the club exclusively. The committee feel that there should be no difficulty in obtaining this amount, as there are among the club members so many who are interested in the sport of yachting who thoroughly enjoy witnessing yacht races but have not the time nor inclination to permit of their owning and racing yachts themselves, and we feel that we should look to these gentlemen for support by liberal subscription to the proposed challenge cup.

We further recommend that the Directors of the club appoint a committee who will formulate rules governing annual races to be taken part in by boats of this class belonging to any recognized yacht club enrolled in the Yacht Racing Union of the Great Lakes, which races shall be a series of three out of five, raced for at Chicago in July or August each year for the "Centennial Challenge Cup," the ownership of the cup always to rest with the Chicago Y. C., but the cup to be held by the winning club and returned to us by July the first, each year; the owner of the winning boat to be presented with a silver replica of the cup as a prize and his name and the yacht winning the cup engraved upon the trophy. Furthermore, the races should be sailed under existing rules of the Yacht Racing Union, and for judges there should be selected one active member from each club, having entries in the annual race.

In conclusion, we feel that this would promote the building up on the Great Lakes of the 30ft. fast cruiser, an admirable type of yacht—one that would give much pleasure to its owner, either in racing or cruising, that would be safe in all weathers, easy to handle, and, with reasonably good care, have a long life of usefulness.

Respectfully submitted,

DWIGHT LAWRENCE,
E. P. WARNER,
S. P. WELLS, JR.,
WM. HALE THOMPSON,
G. H. ATKIN.

Chicago, Nov. 7.

LINES—OUTBOARD PROFILE AND CABIN PLAN OF 60-FOOT HOUSE-BOAT—DESIGNED BY CHARLES D. MOWER FOR THE LATE JULIAN RIX.

Sixty Foot House-Boat.

WHILE, perhaps, not a house-boat in the strictest sense of the word, this design may be properly classed as a cruising house-boat, as she represents a type between the true house-boat and the yacht. While possessing all the comforts of a house-boat in the way of living accommodations, a boat of this type is capable of summer cruising on such waters as Long Island Sound and the Great South Bay, or the inland water ways of New York State, and is especially adapted for winter cruising southward and in Florida waters. The design was drawn to accommodate the owner and one or two guests only, so an extensive arrangement of sleeping quarters was not desired. The general arrangement shows a large main cabin in the middle of the boat.

In addition to serving as a living room, this cabin was to be used as a studio and work room, and for this reason an unusually large skylight was placed over head, and large double windows on either side. As a general living room the double length of sofas on the port side makes a comfortable lounging place, which can be made up into berths at night if necessary. The alcove at the forward end makes a place for a large desk, which is not only a convenience but almost a necessity to the average owner. At the aft end on the port side is a sideboard with china closet above, and a small locker at the side. On the starboard side the table occupies the middle portion with a small upholstered seat at either end, and a convenient arrangement of lockers. At the forward end is an open grate yacht stove for comfort in cold and damp weather. The cabin is about 18ft. by 14ft., which would make a large room even in a house, and has seven feet of headroom. The finish was to be of natural wood, with beams and framing exposed, and panels between all stained to a dark, dull finish. The upholstery was to be leather, and the furniture of very simple design.

The living accommodations are forward, and comprise two state rooms and a bath. The owner's room is in the forward end of the house in order to get light and ventilation from windows on three sides. The guest's room is smaller. The bath room is quite large, having a good size tub, fixed wash basin and water closet. The floor of this room was to be tiled,

and the plumbing all exposed and thoroughly up-to-date in every particular. While not opening directly from either state room, the toilet is easily accessible from both, as well as from the main cabin, by a passage cut off by a portiere.

The working part of the boat is all aft the owner's part, and, though the space is small, it is arranged in such a way as to give the necessary room to work. The motor is installed in the passageway, protected by brass hand rails on the side where people must pass it. The galley is large, having the regular stove, sink, lockers and cupboards. A feature worthy of notice is the ice chest, unusually large and built so that the ice is put in from the deck outside, while the stores and food are reached through doors in the galley. A small state room on the starboard side gives a place for the cook and engineer, and just forward is a large locker for linen, etc.

The boat is to be handled from the after deck, the steering wheel being placed on the aft end of the house with the controlling levers of the motor conveniently placed near at hand. The space under the deck at the ends is utilized for stores, gasoline supply tanks, etc. On top the house is a big promenade deck covered by a double awning with a heavy rail at the sides. This deck is unobstructed, except for the skylight and the fresh water tanks which form settees. The boats are carried on davits, hoisted above the promenade deck, where they can swing inboard for canal work.

The dimensions of the hull are: Length over all, 60ft.; length waterline, 55ft.; breadth, 16ft.; depth, 4ft. 6in.; draft of water, extreme, 2ft. 6in.

The design shows a hull of simple and cheap construction, yet strong and heavy enough so that the boat can stand the hard usage encountered in canal work, and can be run aground without danger of straining. The specifications call for yellow pine in almost every part of the hull; the framing being heavy, the bottom planking 2½in. thick and the side planks 2in. thick.

The cost of such a boat depends greatly upon the amount expended upon the cabin, finish, fittings, furnishings, etc. An approximate estimate on the cost of the hull complete with house—not finished inside—deck fittings, etc., would be two thousand dollars. The motor would cost, say about twelve hundred, and an-

other thousand would be expended on the cabin work, making the total cost somewhere about forty-five hundred dollars.

The boat was designed by Mr. Charles D. Mower for the late Julian Rix.

Race for Harmsworth Cup.

MR. JOHN H. McINTOSH, secretary of the American Power Boat Association, received the following letter on Dec. 1 in regard to entries for the Harmsworth International cup race for motor boats to be held during 1904:

Dear Sir: I have the pleasure to inform you that, by the consent of the donor, entries for the Harmsworth International Cup for Motor Boats can now be received by the Automobile Club up to midday on Feb. 1, 1904. Entries have to be made through the recognized club of the various countries competing, and an interval of six months will be given between the receipt of a challenge and the holding of a race, which will probably be held in the Solent some time in August. The only qualification for entry is that the boat shall not exceed 40ft. over all.

I should be very much obliged if you could kindly make this as widely known as possible in order that there may be a large entry for this very important trophy. Yours faithfully,

BASIL H. JOY,

Technical Secretary.

The races for this cup are governed by the rules adopted by the Automobile Club of Great Britain. The Harmsworth Cup Committee recently decided "that no alteration be made in the rules in any one year after the receipt of the challenge," and that there shall be a minimum period of six months between the race and the receipt of the challenge in any one year, and that every boat in order to be eligible to take part in the race must be fitted with such mechanical power as will drive her astern at the rate of not less than four knots an hour in still water.

The first annual dinner of the Bensonhurst Y. C. was held on the evening of Nov. 30 at the Assembly in Brooklyn. Commodore A. C. Bellows acted as toastmaster, and over fifty members and their guests were present.

Southern Y. C.

NEW ORLEANS, La., Nov. 16.—*Editor Forest and Stream:* There was printed in your issue of Jan. 31, 1903, a lengthy article on the Southern Y. C. new rules for measurement and time allowance, which had just been adopted, and there were given also deductions and reasons why the novel departures in the way of a measurement rule and method of time allowance were made. The measurement formula, which has proven eminently successful here in a season's trial, is "85 per cent. of the square root of the sail area (as measured by the old Seawanhaka rule) equals the racing length," or, more properly, the racing rating; or, $VSA \times .85 = \text{rating}$.

The Herreshoff time allowance tables were discarded, and to use with the measurement formula, a rule was adopted making the figure of time allowance an arbitrary one of "five seconds per foot difference per mile of course." This has also been found to work well in practice, and the Southern Y. C., nor the five other clubs enrolled in the Southern Gulf Coast Yachting Association would think for a moment of wishing anything better at the present time.

As a general proposition the yachtsmen of the South are rather conservative, and, while it was realized last year by a few that our classes could be made more wholesome by restrictions and limitations, it was thought best to go slow and not attempt too much at one time, so the rule makers were content with a start in the right direction.

Prominent among the writers and the designers who look with favor upon the new rule was Mr. B. B. Crowninshield, of Boston, who said that "the rule was an excellent one." At that time Mr. Crowninshield endorsed the writer's views that the various classes to race under these rules would be kept from too much of a racing machine type by the adoption of scantling restrictions and a maximum limit over all length for each class. These suggestions have just been adopted by the Southern Y. C., and by the S. G. C. Y. Association. It would have probably been better had the committees gone farther and greatly improved the classes by having a minimum limit on least freeboard, a minimum limit on beam and likewise a minimum limit on ballast; the latter insuring a depth of hull, which the displacement rules of the North attempt to encourage, the limit on freeboard insuring at least a certain fixed weight off hull, and the minimum beam assuring that boats too narrow are not produced. The limit of sail area is already fixed by the upper limit of the class rating.

The scantling restrictions adopted are patterned after those of the Y. R. A. of Massachusetts, our two classes corresponding to their 25ft. and 21ft. cabin sloop, restricted classes. A third restricted class was adopted in the shape of a 20ft. one-design knockabout class, boats to be eligible to be built exactly from plans and specifications as gotten up by Mr. C. D. Mower.

The classes and the limitations and restrictions are as follows:

Class of 30 Rating and Over—Stem, sided at head, $3\frac{1}{2}$ in.; keel, minimum thickness, $3\frac{1}{2}$; frames, maximum spacing, 12in., sectional area at bilge, 3; bilge stringers, sectional area, middle 4, ends 3; deck beams, maximum spacing 12in., sectional area, $3\frac{3}{4}$; planking, mill-dressed, 1in. thick. Maximum limit on over all length, 50ft.

Class Under 30 Rating—Stem, sided at head, $2\frac{1}{2}$ in.; keel, minimum thickness, 3; frames, maximum spacing 12in., sectional area at bilge $2\frac{1}{4}$; bilge stringers, sectional area middle 3, ends 2; deck beams, maximum spacing 12in., sectional area $2\frac{3}{4}$; planking, mill-dressed, $\frac{3}{4}$ in. Maximum limit on over all length, 40ft.

General specifications and explanations of scantling table:

Stem—The minimum siding (thickness) measured at the rabbet at highest point on stemhead, no decrease of siding allowed.

Keel—Minimum thickness allowed for a length of one-third of the load waterline length, beyond which may be tapered to one-third less at stem and stern. The breadth of keel will taper from point of greatest section to siding of stem and stern.

Frames—The sizes laid down in the table show the minimum uniform sectional area of bent frames, the siding multiplied by the moldings. The sectional area is that of a single frame for a uniform spacing between centers of not exceeding 12in. This required area may be made of smaller frames spaced closer together, area being proportionally decreased, or of combinations of large and small frames with appropriate spacings. This minimum sectional area shall apply to a space of at least two-thirds of the L. W. L. length in the center of the vessel; forward and aft of this, the sectional area may be reduced 20 per cent. Two adjoining frames abreast each mast, and one at each runner plate must be increased in size in proportion as they are cut by the chain-plate fastenings. Sawed frames must be one-third larger in sectional area at least than bent frames.

Spacing of Frames—The maximum spacing of frames as given in table, is based not on the size of the frames, this being variable, but on the thickness of planking allowed for the class, being the greatest spacing that will insure a tight seam with the usual calking for the minimum thickness of planking allowed.

Bilge Stringers—The minimum sectional area at middle shall cover at least one-half the full length of bilge stringer, with taper allowed at the ends. At least one bilge stringer must be run on each side, at about the lower part or turn of bilge. In yachts whose extreme beam exceeds twice the greatest depth from under side of deck to upper side of keel, two such stringers on each side must always be fitted. Two bilge stringers and two clamps to be full length of boat.

Deck Beams—The sectional area of deck beams shall cover at least the middle third of the beam, allowing a taper, in the molding, to each end. There must be one larger main beam at the bits, two at each mast (partner beams), one at fore end of cabin trunk, one at after end, two at each skylight, hatch and companion

in flush-decked vessels and one at transom. The auxiliary beams and the half beams abreast of house, skylight, etc., may be of smaller areas. The beams may be spaced at will, provided the maximum distance between centers does not exceed that given in the table. The beams should be jogged into the shelf or clamp a distance equal to one-third the molded depth of beams at end.

Floors—There shall be at least six strong floors in the center of the vessel and two at each mast step.

There shall be but one rudder and one board.

L. D. SAMPSELL.

Boston Letter.

BOSTON, Dec. 7.—There is a movement on foot at present to start a class of 30-footers to be raced under the auspices of the Eastern, the Corinthian and the Manchester Y. C. It is said that these yachts, if built, will also take part in the open events of the Yacht Racing Association of Massachusetts, if that organization will adopt the class when formed. It is said that there are five yachts in view, but some of the prospective owners have yachts at present in the 25ft. restricted class, and their entrance into the new class may depend upon the sale of their old boats.

What the restrictions and the system of measurement of the new class are intended to be have not, as yet, been announced. The Yacht Racing Association has already adopted a 30-rating class, the rules for which are expected to be put into such shape at an early date that yachtsmen who intend entering may go ahead with the building of their boats. As long as it will be necessary to provide some system of rules and measurement for the proposed Marblehead 30-footers, it would seem reasonable to have the promoters of that class confer with the promoters of the newly adopted class of Y. R. A. 30-raters. A class of 30-footers would undoubtedly prove successful in Massachusetts Bay waters, once it has been started, but it is very doubtful, if two classes should be formed, that either would prove very successful. There has not been any racing of 30-footers in these waters since 1899, and it does not seem that the revival of interest is great enough to warrant the formation of two classes. An endeavor was made at starting a class of 30-footers at Marblehead a year ago, but for some reason the scheme fell through. There is no doubt that such a class is wanted, and upon the yachtsmen depends its introduction.

A practical indorsement of the new Y. R. A. 21ft. class has come from Rear Commodore Walter Burgess, of the Boston Y. C., who has ordered one of the boats, and also from Mr. W. B. Stearns, of the Marblehead Yacht Yard, who will design the boat. Rear Commodore Burgess is one of the most enthusiastic yachtsmen in the country, and is a veteran racing man. He is an exponent of the sound construction and rational form idea, and has always owned good boats. He has not participated in active racing to any extent in the past few years, and has made no secret of his reason being that the kind of boat allowable under the rules was not the type he desired to own. He feels that the new 21ft. class fills the bill.

Mr. W. B. Stearns, who has been asked to design the boat, speaks very highly of the class, and, on account of his great familiarity with raceabouts, knockabouts, and other boats of about 21ft. waterline, his opinion is of great value. Mr. Stearns says that the boat to be produced under the rules of the new 21ft. class is of a good, healthy type, is a stronger and better boat all-round than those built under the raceabout rules, and more of a racer than the old knockabout. He says further that the type is the logical outcome of a demand for a racing restricted class, somewhat larger than the 18-footers, and without the full lines in the bow, which, he states, make the 18-footers objectionable to many.

The deductions of Mr. Stearns tend to show that this new class is exactly what was intended to be obtained when Hon. Charles Francis Adams, 2d, went to work on the rules. The length of the boats appeals to many yachtsmen, as was shown by the great interest manifested formerly in the raceabout class. The raceabout class, however, has lost much of its footing in Massachusetts waters, and the new class is calculated to prove a very worthy substitute.

It is in the 18ft. knockabout class that the greatest activity is being shown up to date. It is known that eight new boats are building or are to be built, and it is likely that more will be heard from before the building season closes. This class seems to gain in popularity from year to year rather than to lose. Some changes in the rules were made recently, but the only effect they will have will be to strengthen the class. Some of the older boats have changed hands, but the owners are more content to hang on to 18-footers than they are to yachts of other lengths. The reason for this is undoubtedly in the establishment of rules that give a yacht as good a chance in one year as another.

A few boats have been ordered under the rules of the newly adopted Y. R. A. 15ft. class, but the number is not yet great enough to assume that a lively interest is being taken. The 22-footers will be raced next season, and it is possible that one or two more boats will be built. Mr. C. C. Clapp has been spoken of as a prospective builder in the 22ft. class, but as yet it is not known that he has placed an order. It is quite doubtful if any boats will be built this winter for the 25ft. restricted class. There are four boats in the class that may be raced next season, however.

Mr. B. B. Crowninshield is at work on the lines of a 28½ft. auxiliary yawl for Mr. T. R. Wheelock, of Boston. This yacht will be built and will be sailed at St. Andrews, N. B., where Mr. Wheelock has a summer residence. She will be supplied with a 10 horse-power, 2-cycle kerosene motor. Mr. Crowninshield also has an order for a keel raceabout for a New York yachtsman. This boat will have a straight sheer and will have much more tumble home than is usually seen. He is drafting changes in Uncle Sam, the 21-footer, which captured the German Emperor's cup at Kiel. Uncle Sam will be given a greater draft and a larger rig. The sails, blocks, and rigging will be made in Boston. He also is at work on the lines of a 50-ton fisherman for Capt. Joseph McGill, of Shelburne, N. S., to be used in rip fishing. The 18ft.

knockabout which this designer turned out for Mr. Linus M. Chase, has been completed at Lawley's.

The greater part of the new work in the yards at present appears to be on power boats. This is particularly the case in the smaller yards, although the larger plants are probably turning out more power boats than anything else. Messrs. Murray and Tregurtha have just finished a 45ft. launch for Mr. Thomas H. Webb, of Peoria, Ill., a prominent member of the Columbia Y. C., of Chicago, and of the Corinthian Y. C., of Marblehead. She is called the Saint, and was built to take the place of the Sinner, which Mr. Webb owned last year. Saint is of the torpedo-boat type, 45ft. waterline, 42ft. on deck, 8ft. beam, and 3ft. draft. She has a 3-cylinder, 16 horse-power, Murray and Tregurtha engine, which will send her better than 11 miles an hour. On her trial trip she covered measured miles in 5 and 6 minutes. Although she is somewhat narrow, as gasoline boats go, she has good room, and is fitted up for cruising. After spending some time on Lake Michigan Mr. Webb intends cruising down the Mississippi to New Orleans.

JOHN B. KILLEEN.

Lake Sailing Skiff Association.

THE annual meeting of the Lake Sailing Skiff Association took place in Hamilton a short time ago. The following officers were elected:

F. Birley, President; R. Slee, Vice-President; H. F. Darrell, Secretary-Treasurer. Executive Committee—E. K. M. Wedd, Royal Canadian Y. C. of Toronto; G. Judd, Royal Hamilton Y. C. of Hamilton; H. Sweetlove, Queen City Y. C. of Toronto; Jas. Comford, National Yacht and Skiff Club of Toronto; C. F. Crawford, Victoria Y. C. of Hamilton; T. A. E. World, Royal Toronto Sailing Skiff Club; W. Gibson, Parkdale Sailing Club of Toronto; N. Forest, Toronto C. C. of Toronto; W. Gibson, Mimico Boating Club of Toronto.

Two new classes were added to the association—a small ballasted class and an 18ft. dinghy class.

The ballasted class restrictions are as follows:

A. Maximum L. W. L. 16ft.
B. Maximum draft 4ft.
C. Sail area 350 sq. ft.
D. Minimum beam L. W. L. for keel boats, 5ft. 7in.; minimum beam L. W. L. for centerboard boats, 6ft. 2in.
E. Minimum area largest immersed vertical cross section, 6.125 sq. ft.
F. Minimum draft for at least 4ft. length of keel, 2ft. 3in.; minimum freeboard keel boats, 18in.; minimum freeboard centerboard boats 17in.

H. Cabin trunk, width not greater than 70 per cent. or less than 50 per cent. of the greatest beam on deck. Cabin trunk height at least $2\frac{1}{2}$ in. for every foot greater beam.

I. Stem-sided at head, 2in.
J. Forward overhang timber oak, rock elm or fir, $1\frac{3}{4}$ in. thick.
K. Aft overhang timber of the same.
L. Frames, oak or rock elm, sectional area 1 sq. in., spacing, 9in.
M. Floors, $\frac{7}{8}$ in. thick.
N. Clamp, oak, rock elm or fir, hard pine or spruce, $2\frac{3}{4}$ in.
O. Bilge stringer of the same.
P. Deck beams oak, sectional area, main $2\frac{1}{2}$ sq. in. auxiliary $1\frac{1}{2}$ sq. in., half beams 1 sq. in., spacing 9in.
Q. Planking to finish full 11-16in.
R. Deck to finish full $\frac{5}{8}$ in. thick.
S. House deck to finish full 7-16in. thick. Solid spars; wood centerboards, weighted only sufficient to sink; 75 per cent. sail area to be in mainsail; 25 per cent. sail area in fore triangle.

Sailing dinghy class, 18ft. over all: Minimum beam, 5ft. 6in.; depth, 18in.; planking, $\frac{3}{8}$ in.; ribs, 1in. by 1in., 9in. centers; centerboard not over 75 pounds; sail area, 250 sq. ft., main and jib.

It was intimated the Rochester Y. C. may join the L. S. S. A. If so, international racing in the small classes will be the result. The other class now in the association is 16ft. class (corrected length), viz., 24ft. over all, about 13ft. L. W. L.; 6ft. 6in. beam, 12in. freeboard, 330 sq. ft. canvas (rig sloop), 100 pound board, $\frac{3}{8}$ in. planking, ribbing, 1 sq. in. to the foot; also a 14ft. sailing dinghy with 150ft. canvas.

The annual regatta will take place in Toronto July 1, for Walker cup, 16ft. class; Birley cup, dinghy class; Labor Day the Cakewalk cup in Hamilton.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Messrs. Cousens & Pratt are at work upon sails for a 50ft. L. W. L. yawl, built by Mr. Lawley for Mr. Robert Saltsonstall; 52ft. schooner, building by Lawley for Mr. J. H. Cromwell; also new suits for the schooners Baboon, Gerfalcon, Penelope and Columbia; the 25ft. knockabouts Kalifa and Margaret; Burgess Packard, 21-footers for Mr. T. W. Rogers and Mr. Chester Beare. A 21-footer for the new Massachusetts Y. R. A. class, designed and built by Stearns & McKay for Mr. Walter Burgess. The 21ft. knockabouts Betsey and Jennie Wren; the 18ft. knockabouts of Boardman's design, for Mr. J. W. Olmstead, R. Chas. F. Adams, 2d, Mr. C. H. W. Foster and Mr. R. DeB. Boardman; from Burgess & Packard's design, for Mr. Bowden, and from Mr. Crowninshield's design for Mr. Geo. P. Keith; also a 15-footer for the Massachusetts Y. R. A. class, designed by Boardman, for Mr. Pevear, of Annisquam, and a class of nine racing dories, built by Emmons, and designed by Mr. C. D. Mower.

The schooner building at the Townsend & Downey plant at Shooters' Island, S. I., from designs by Messrs. Cary Smith and Barbey, is for Mr. Chester W. Chapin. The vessel is built of bronze and will be known as Azara. She is 113ft. over all, 85ft. waterline, 21ft. 4in. breadth and 5ft. 8in. draft.

The annual meeting and dinner of the Manhasset Bay Y. C. was held at the Hotel Manhattan on the evening

WHISTLEWING.
Designed by Tams, Lemoine & Crane, built by B. F. Wood, and owned by Gordon Pirie.
Photo by N. L. Stebbins, Boston.

of Tuesday, Dec. 1. The following officers were elected: Com., A. H. Alker; Vice-Com., Charles W. Lee; Rear-Com., H. Winslow White; Sec., Edward M. MacLellan; Treas., Guy W. Buxton; Meas., Charles D. Mower; Trustees, Class of 1906, W. Butler Duncan, Jr., and Andrew J. Onderdonk.

The secretary's report showed a total membership of 269, and a fleet of 169 yachts, consisting of 17 schooners, 20 yawls, 32 sloops and cutters, 21 raceabouts and knockabouts, 14 catboats, 29 steamers, 4 house-boats and 32 launches.

All the amendments to the constitution were passed except the one which related to ladies' privileges about the club house and that was defeated.

Resolutions of sorrow were adopted over the death of Julian Rix, who died a few days before the meeting. Mr. Rix was to have been elected an honorary member of the club. Suitable resolutions will be forwarded to Mr. Rix's relatives.

The new home of the Morrisania Y. C. on South Brother Island, has been completed and will be kept open all winter. It is hoped that the members will make it a point to visit the house whenever it is possible for them to do so. The club launch will make its customary trips between South Brother Island and the foot of 138th street, East River.

The South Bay Y. C. is to build a club house on Cedar avenue, Patchogue, on ground given by Mrs. Kate L. Gilbert for the site. It is desired to expend not less than \$5,000 in erecting and furnishing the new building. The officers are: Com., Joseph Bailey; Vice-Com., A. Rae Storms; Rear-Com., George L. Robinson; Sec., Frank Guttridge; Treas., Edwin Bailey, Jr.

It is very probable that the Manchester Y. C. will have a trial boat in the races to be held by the White Bear Y. C. for the selection of a challenger for the Seawanhaka cup. The boat will be designed by Mr. E. A. Boardman, and the same sails, spars and gear that were used on Kolotoo will equip the new boat.

The big shipbuilding plant of the Townsend & Downey Co., of Shooters' Island, S. I., has been shut down and 1,200 men have been thrown out of work. Labor troubles are said to be the cause. It is very probable that the business will be reorganized.

The schooner Ingomar, owned by Mr. Morton F. Plant, is now in the south shop at the Herreshoff works at Bristol, where she is undergoing some extensive alterations. Ingomar is to race in British waters next season, and in order that she may secure a better measurement under the girth rule, now in effect there, her centerboard has been removed and her lead keel will be lowered, so that her draft will be increased to 16ft. Some changes and improvements will also be made in Ingomar's internal fittings, and arrangements are being made for the accommodation of 28 men.

the cups won in the fall regatta. At the October meeting the initiation fee was made \$5, in an attempt to keep down the membership, which was outgrowing the accommodations of the house. It had not the desired effect, however, and a new house will be built during the spring and the present one used for lockers.

Rifle Range and Gallery.

New York Central Corps.

NEW YORK.—The Central Corps' second gallery shoot in the series at the Zettler range, Dec. 4, had scores as follows:

Ten-shot scores, two to count: R. Gute 240, 236; F. Kost 238, 232; D. Scharninghaus 227, 240; J. N. F. Siebs 230, 235; Geo. Viemeister 233, 229; J. von der Lieth 230, 227; F. Rolfs 227, 223; H. D. Muller 224, 224; J. Baumann 225, 217; A. Bitterhoff 224, 216; W. Schillingmann 212, 225; B. Eusner 216, 220; W. J. Daniel 218, 217; Chris. Gerken 218, 217; J. Feldscher 223, 216; H. Schrader 209, 217; H. Roffmann 199, 216; C. Tietjen 202, 217; F. Jaegers 200, 217; H. von der Lieth 208, 201; H. A. Flicke, Jr., 192, 208; P. Engelking 197, 200; G. Rolde 193, 191; A. Ihlenberg 190, 193; J. Speckmann, Jr., 160, 194; H. Eckhoff 177, 172; G. Dettloff 71, 197.

Bullseye target, 4in. carton, best center shot to count by measurement by degrees: F. Kost 58½ degrees, J. von der Lieth 66, W. J. Daniel 70, H. Roffmann 70½, Ch. Gerken 71½, A. Ritterhoff 74, H. von der Lieth 80, G. Rolde 81½, R. Gute 84, J. N. F. Siebs 91½, G. Viemeister 93, J. Feldscher 110, W. Schillingmann 112, B. Eusner 124, F. Rolfs 123, H. A. Flicke, Jr., 140, F. Jaegers 14½, D. Scharninghaus 151, A. Ihlenberg 167, J. Seckman, Jr., 194, P. Engelking 195, H. Eckhoff 235.

Zettler Rifle Club.

NEW YORK.—The Zettler Club held its annual meeting on Dec. 1. The old board of officers was re-elected as follows: Gus Zimmerman, President; H. D. Muller, Vice-President; F. Hecking, Secretary; E. Van Zandt, Corresponding Secretary; Chas. G. Zettler, Treasurer; B. Zettler, Shooting Master. After the close of the meeting the members proceeded to shoot their scores in the weekly winter gallery tournament. Scores:

Ten-shot scores, 25-ring target, 75ft.: L. C. Buss 2458, R. Gute 2426.

Fifty shots: C. G. Zettler, Jr., 1225, C. G. Zettler, Sr., 1201, H. Holges 1200, H. D. Muller 1119, W. A. Hicks 1198, B. Zettler 1194, H. C. Zettler 1190, L. Maurer 1184, T. H. Keller, Sr., 1155, G. J. Bernius 1127, T. H. Keller, Jr., 1119.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of this association on Nov. 22, the following scores were made. All shooting off-hand, 200yds., 25-ring target. Mr. Bruns just returned from a hunting trip and shot well above his average. There were also a few good honor scores made:

						Honor.
Bruns	224	214	212	212	206	67
Hasenzahl	223	219	218	217	211	56
Gindele	222	219	211	206	186	71
Strickmeier	216	214	207	194	188	70
Payne	215	214	214	212	206	66
Hofman	214	213	207	202	200	60
Hofer	210	204	201	190	189	52

Freitag	201	199	198	196	193	52
Lux	199	194	185	177	176	58
Trounstone	180	160	128

New York City Corps.

NEW YORK.—The New York City Corps on Dec. 3 opened the winter gallery contest. Aug. Kronsberg was high; Capt. Busse was second. Scores:

Ten shot scores, two scores to count: Aug. Kronsberg 241, 239; R. Busse 239, 239; J. Fackiamm 231, 234; O. Schwanermann 229, 234; B. Eusner 221, 234; A. Frank 222, 226; R. Bendler 223, 224; Chas. Wagner 213, 224; H. Radloff 204, 222; Chas. Schmidt 211, 211; Chas. Metz 199, 203; T. E. Steuhl 182, 212; J. Keller 190, 190; H. Vogel 208, 190; A. Wiltz 191, 183; A. Michaels 179, 173; W. Heil 139, 170; J. Joerus 140, 113.

Pesque Isle Rifle Club.

ERIE, Pa., Nov. 14.—Only five members were present to-day, and a high gale of wind from the north prevented any high scores being made. Scores:

W A Parker.....	78	72	71—221	J Almeda.....	65	63	59—187
J A Auermann.....	74	68	67—209	A Mount.....	59	57	55—171
J Bacon	67	63	62—192				

CABIA BLANCO.

Rifle Notes.

The Lady Zettler Rifle Club will hold its monthly shoot on Dec. 12.

The Castle and rifle range at Union Hill Park will be opened to the public on Dec. 19. It will be open for target practice on Saturday afternoon each week until April. Many improvements will be made during the winter, to put it in shape for the Bundesfest next June.

Mayor Adolph Lankering, at a meeting of the Schuetzen of Hoboken last week, promised them a prize of \$500 from the citizens of Hoboken for the target of honor at the Bundesfest.

The executive board of the National Bund will meet at headquarters, No. 12 St. Marks Place, New York, Dec. 11, at 8 o'clock P. M.

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

114-116 Market Street, San Francisco.

Cincinnati Gun Club.

CINCINNATI, O.—The weather on Dec. 5 was clear and cool, with little wind, and the attendance was consequently much larger than on the previous Saturday. The main event was the contest in the cash prize series. Seventeen shooters took part. Gambell was high gun in this with 46; A. Sunderbruch second with 43. R. Trimble, from the 21yd. mark, came third with 41. Some practice was indulged in, but the early coming of dusk stopped the sport at about 4:30.

Mr. Eugene Dupont, of the Dupont Powder Co., Wilmington, Del., visited the grounds to-day in company with Mr. F. S. Waddell.

Ralph Trimble starts on Monday for a trip through Ohio. Colonel will leave next week for Galveston, Tex., and thinks he may get a few ducks. There are plenty of them in that locality, and we believe that he will have good sport and get a good bag. Here's luck to him.

Thos. H. Cassity, of Nashville, Tenn., was in the city to-day. He made only a brief stop, as he is on his way to New Haven, Conn.

Supt. Arthur Gambell gave his annual game supper to a few friends on Dec. 1. The game was prepared in the highest style of the culinary art by Mrs. Gambell, and those who were fortunate enough to attend had the time of their life. Stan, Rhoads, Del Gros, Lew Pfister were among the guests, and the time was passed in story-telling, singing, etc., the party not breaking up until the "wee sma' hours." They'll all be on hand next year.

Following are additional scores, allowance handicap, made in the Parker prize contest of Nov. 23, by those who were unable to be present owing to the storm: H. Sunderbruch (40) 100, Gambell (10) 98, Medico (12) 99, Dick (22) 94, Van Ness (12) 86, Maynard (18) 86, A. Sunderbruch (10) 79, C. Dreih's (0) 65, Colonel (55) 80.

The following scores were made in the cash prize contest, 50 targets, distance handicap, on Dec. 5: Medico (19) 32, Williams (18) 22, Block (19) 30, A. Sunderbruch (18) 43, R. Trimble (21) 41, Gambell (16) 46, Harig (16) 36, Maynard (17) 32, Captain (16) 33, Jay Bee (16) 26, Ackley (15) 25, Du Bray (16) 34, Herman (16) 23, Colonel (15) 16, Waddell (16) 29, Vullerdick (16) 38, E. Dupont (16) 35.

Those eligible in the cash prize contest number six in Class A and eight in Class B. Their best ten scores to date follow:

Class A.

Block	41	42	40	43	46	34	34	36	34	32	—382
Coleman	40	41	41	40	41	38	38	37	36	36	—388
Gambell	40	42	45	44	40	43	41	42	41	44	—422
Maynard	43	41	40	41	46	41	37	37	36	35	—397
Medico	41	40	45	43	41	48	43	39	39	39	—418
Trimble	43	43	47	44	43	45	42	45	45	41	—439

Class B.

Ackley	41	44	37	35	33	33	32	32	32	29	—348
Barker	41	43	45	48	41	41	41	44	42	38	—424
Faran	41	42	41	42	39	39	38	37	35	35	—389
Falk	39	39	38	38	37	36	36	35	35	34	—367
Herman	40	44	36	31	37	36	33	36	34	32	—359
Jack	42	47	37	37	36	34	34	33	32	32	—364
Jay Bee	41	38	41	38	37	37	36	36	35	35	—374
A. Sunderbruch	45	45	44	44	42	41	40	40	39	36	—416

The club held its usual holiday shoot on Thanksgiving Day. The weather was clear and cold, but a strong wind blowing across the traps made the targets very erratic in their flight, and the scores were very low. It is seldom that 74 out of 100 takes high gun on these grounds.

The entrance to the programme events was \$12.50, money divided Rose system, 5, 3, 2. Fourth prize in each event was a fine 12lb. turkey. After the shoot-offs the following won the turkeys: Herman two, Faran two and Ahlers four.

One-half cent for each target shot at was set aside, half to be divided among the two high guns, 60 and 40 per cent.; the other half to three low guns divided equally.

Medico won high gun on 74, and received \$2.35; Dreih's second on 69, \$1.60. The three low guns, Herman, Williams and Faran, received \$1.30 each.

A. W. du Bray returned a few days before from an extended stay in the Northwest. The totals of ten 10-target events follow: Jay Bee 52, Maynard 66, Gambell 66, Ahlers 67, Barker 61, Faran 59, Medico 74, Herman 30, Harig 47, Williams 56, Dreih's 69.

Colonel shot at 80, broke 11; Ackley shot at 50, broke 23. Shoot-off of ties for turkeys, 10 targets:

First event: Herman 4, Faran 6.

Third event: Barker 7, Faran 5.

Fourth event: Gambell 7, Ahlers 8, Barker 7, Faran 8. Shoot-off of second tie: Ahlers 7, Faran 3.

Sixth event: Ahlers 8, Faran 6.

Seventh event: Ahlers 6, Herman 2.

Only eight took part in the contest, 100 targets, handicap in the Parker gun series. It was cold and a thick fine snow was blown into the faces of the shooters, making good scores an impossibility. The scores follow: Jay Bee (25) 78, Williams (18) 97,

Roanoke (40) 96, Block (16) 79, Gambell (10) 83, See (10) 93, Herman (25) 80, Medico (12) 72.

BONASA.

Ashland Gun Club.

LEXINGTON, Ky., Nov. 26.—I append herewith a clipping from the Lexington Democrat containing an account of our regular weekly shoot.

ROBT. S. SKINNER.

The Ashland Gun Club yesterday afternoon held its regular weekly club shoot.

Several of the members are out of town on their annual hunting trips. Those who were at the meeting had a most enjoyable little shoot, making, too, some excellent scores.

Everybody seemed to be in fine humor, even to the trap boys, who kept continually changing the angles and occasionally giving vent to a mocking laugh as a target would be missed by the shooters.

Roger H. Smith was out for the first time in many months, he having but recently recovered from a long illness and operation on his ear; but Roger with his little 16-gauge showed the boys that he had not forgotten how to smash 'em. It is worthy of note how many of the shooters here are taking to the 16-gauge guns, not only for the field, but for target shooting. George K. Graves, who has been absent for several weeks in New York, was out with his 16-gauge, and shot exceedingly well, breaking all of his previous records.

Ed Perry, Earl Sellers and K. G. Pulliah, other fanciers of the smaller gauge gun, were not present yesterday, but W. B. Talbert, the genial proprietor of the Blue Grass Commission Co., was on hand with a brand new "pump" gun, and by his scores it seems that he now has a gun that fits him.

Frank Van Deren shot "like a house afire," and in every event, all being 15-target events, he and Bob Skinner were right there in the 'teens. Much amusement was furnished for the spectators when Frank gave his rival for the honors of the afternoon a few shells of a new kind "just to try," and of course you know who finished high gun.

The club will shoot Tuesday afternoons when the weather will permit, and after the holidays may have a big live-bird shoot and dinner.

Sunny South Handicap.

BRENNHAM, Texas, Nov. 28.—The Sunny South Handicap shoot, to be held here Jan. 18 to 23, 1904, promises to be very largely attended. We are now having our grounds rearranged and preparing to enlarge our club house. Nothing will be left undone that will add to the pleasure and comfort of the attendants. In time for the shoot, we will have everything in shape to take care of any number of shooters. We will have four sets of target traps and four sets of live-bird traps ready for use, and as many sets as the attendance justifies will be used.

Among some of the special attractions, aside from the regular handicap events, will be the contest for the Houston Chronicle trophy. This trophy is an elegant loving cup, emblematic of the Southern States' amateur target championship, and is to be shot for here once every year in open competition, by the amateur trap shots of the Southern States. It will be open to challenge every thirty days, and must be defended by the holder.

We have secured a suitable trophy to be put up for a ten-man team race. This match will be open to any ten amateurs coming from one State or Territory in the Union.

The Texas team has been organized, and we have heard from several other States that are endeavoring to organize.

All other events of the programme will be open to the world, and will be made very attractive.

We are arranging for a big duck hunt to take place at the close of the shoot. Arrangements are in progress with the railroad company for special cars to leave here and stop at one of the best duck lakes in the South. We will get a special rate for this trip that will not exceed \$2 for the round trip.

ALF. GARDENER.

Imperial Gun Club.

CALAMUS, Iowa, Nov. 28.—The Imperial Gun Club on Nov. 26 held its monthly shoot for members, of whom there were ten present.

In an event at 30 targets, the results were: McCaughy 26, Lund 24, Hazen 28, Arnold 26, Sherman 25, Baldwin 21, Wolfe 16, Keith 18, Gaston 23, Keel 15.

Club gold medal, handicap event, medal held by E. Peterson, and was won by Sherman. Scores: Wolf shot at 35 and broke 11; Arnold 30, broke 23; Keith 35, broke 18; Lind 30, broke 14; Peterson 25, broke 21; Sherman 30, broke 25; Hazen 25, broke 20; Miller 25, broke 18.

Trap Around Reading.

READING, Pa., Nov. 26.—The South End Gun Club, of this city, held its annual Thanksgiving Day target shoot to-day, with a large crowd of sportsmen entered in the different events. The principal event of the day was the club shoot for the new medal offered by the club, each man shooting at 25 targets. James Gicker, with a score of 24 out of 25, won the medal. The scores follow:

Club shoot, 25 targets: Wilson 18, Farr 19, Miles 21, Shultz 15, Matz 22, Yost 23, George 14, Ball 17, Gicker 24, Gerhard 21, Melcher 20, Eshelman 14, Henry 18, Thompson 22.

Open sweepstake events scores follow:

Shot at. Broke.			Shot at. Broke.		
Miles160	128	Shultz	35 29
Dietrich160	119	George55	37
Ball160	119	Melcher45	32

Thompson75	55	F Grill10	3
Yost65	59			

Nov. 24.—At the regular meeting of the Independent Gun Club last evening, the business of the past month was transacted, and the following nominations for officers were made: President, Sherman H. Hoverter; Vice-President, William Kunkelman; Financial Secretary, Marion Larkin; Recording Secretary, George Goldman and George Frees; Treasurer, Harrison Posey; Trustees, Logan Trout, H. F. Moyer, Daniel Shaak, Lincoln Dillon, Irvin H. Tobias, A. G. Sloat and George P. Moyer; Commissarians, George Graeff, Andrew Fisher, Morgan Hemmig, H. F. Moyer; Captain, Harry Weidner.

Pottsville, Pa., Nov. 26.—Peter J. Haverty, of East Mines, defeated John Roehrig, of Orwigsburg, in a live-pigeon match, at 15 birds, by grassing 10 to his opponent's 9 birds. The stake money was \$100 a side. About \$1,500 changed hands. This is Roehrig's second defeat by Haverty.

DUSTER.

Riverside Gun Club.

UTICA, N. Y., Nov. 26.—The Thanksgiving Day shoot of the Riverside Gun Club was a handicap prize competition. The weather was cold. The scratch men were Messrs. Fulford, Jenne, Parmenter, Loughlin, Mayhew and Christian. Charles Brunner, in the tenth event of the qualifying series for the club gold medal, won after shooting off several ties. Scores:

Events:	1	2	3	4	5	6	7	8

Ossining Gun Club.

OSSINING, N. Y., Dec. 5.—Conditions were right for good scores on the grounds of the Ossining Gun Club to-day. While three were not enough to shoot for the rifle and telescope, a big fat chicken raised on the grounds was put up as a prize, distance handicap. Clark won, from the 18yd. mark, with 13 out of 15. Those members who are desirous of shooting on the team against Poughkeepsie on Jan. 1 are earnestly requested to attend the practice shoot to be held on these grounds Dec. 19. There is some object in shooting on the Ossining team, as all regular expenses are paid by the club. Some special prizes will be offered for the 19th inst.

C. G. B.

IN NEW JERSEY.

Fairview Gun Club.

Fairview, N. J., Nov. 26.—The cup shoot of the Fairview Gun Club, held to-day, was emblematic of the club championship. It was won by Mr. Taylor Hurley. It becomes the property of the member winning it three times. A light wind from the north-west blew across the score. The weather was clear. The traps are set Sergeant system.

Referee, B. R. Burdette; scorer, Robt. J. Hopkins.

Franklin Gun Club.

Franklin Furnace, N. J., Nov. 26.—Following are the scores made at the shoot of the Franklin Gun Club to-day:

Shooting at 50 targets, Andrew Wright broke 39; F. Suthren, 30; J. Williams, 40. Alf. Wright broke 16 out of 30; C. Roelimer broke 16 out of 24; J. Stevens broke 14 out of 20.

Shooting at 15, Slacker broke 9, C. Ramage 5, Winters 6.

Shooting at 10, W. Stevens broke 8, A. Suthren 4.

Scores at 10: Reeves 1, Smith 2, Kishpaugh 2. J. E. Stevens broke 4 out of 7; Pope broke 11 out of 14.

Mountainside Gun Club.

West Orange, N. J., Nov. 26.—The scores of the Mountainside Gun Club, made to-day, are appended:

First event, contest for club trophy: J. McDonough 23, G. F. Ziegler 22, J. E. Shelley 20, S. L. Beeble 18, F. Hollum 18, C. J. Ziegler 17, W. Hollum 17.

Second event, 15-bird turkey shoot: J. McDonough 14, G. F. Ziegler 13, F. Hollum 11, C. F. Ziegler 11, J. E. Shelley 13, S. Beeble 11, W. Hollum 11.

Third event, 25-bird turkey shoot: S. L. Beeble 21, J. McDonough 21, C. J. Ziegler 20, J. E. Shelley 19, C. F. Ziegler 18, F. Hollum 17. In shoot-off of tie Beeble won.

Fourth event, 10-bird sweepstake: F. Hollum 10, G. F. Ziegler 9, J. McDonough 8, S. L. Beeble 7, C. F. Ziegler 7, F. Wright 7.

Fifth event, 10-bird sweepstake: G. F. Ziegler 10, F. Hollum 9, J. M. McDonough 8, J. E. Shelley 8, W. Hollum 7.

Hudson Gun Club.

Jersey City, N. J., Nov. 29.—The Hudson Gun Club held its last shoot for November on this date, and had a good attendance. The day was clear and cold, but all seemed pleased to take a hand in smashing the targets. Mr. Pape, Jr., is a son of the well-known hotel keeper of New York, and this was his first visit. In the two 25-target events he shot remarkably well for a beginner. It looks as if he would be heard from later.

The next shoot will be held on Dec. 13.

Cathcart 112220222022121-13

JAS. R. MERRILL, Sec'y.

Pattensburg Gun Club.

Pattensburg, N. J., Nov. 26.—One of the most interesting shoots of the season occurred here to-day. The first event was for the regular monthly shoot, two medals. First was won by Harry Gano, breaking 25 straight. The second by A. E. Holbrook, breaking 21.

The second event was for suppers, between High Bridge and Pattensburg. Pattensburg were the winners, and were treated to a first-class supper. I would say that the High Bridge boys are a team of sports and gentlemen.

The third event was for a repeating Winchester rifle, and as the scores show, it was won by C. W. Bonnell, Harry Gano and A. K. Hellman. It was a give-or-take agreement by these three gentlemen. Harry Gano made high score, breaking in the day's shoot 100 out of 108.

Event 1, 25 targets, for two medals: H. Gano 25, A. H. Hellman 15, C. W. Bonnell 19, L. Kitchen 18, N. Stamets 17, R. Stamets 18, A. E. Holbrook 21, H. P. Milburn 20, H. L. Gano 20.

No. 2, 26 targets, for suppers:

High Bridge.—J. Haim 19, F. Exton 15, A. F. Conover 19, Wm. Sign 17, E. C. Wentzel 17, J. Exton 10, O. E. Brown 15, A. Creager 9, J. Johnson 17, J. W. Wern 12.

Pattensburg.—Harry Gano 21, A. E. Holbrook 21, Jos. Williams 15, C. W. Bonnell 21, N. Stamets 23, R. Stamets 15, H. L. Gano 22, W. S. Bowlby 16, L. Kitchen 15, H. S. Milburn 18.

C. W. BONNELL, Sec'y.

Chicago Gun Club.

CHICAGO, Ill.—A special holiday shoot, open to all amateurs, was held on the club grounds Thanksgiving morning, the contest being for a beautiful solid silver trophy, known as the White Horse Cellular Coronation Snuff Mull, presented by Mr. P. J. Mackie, of Isley, Scotland. It was a 50-target optional sweepstake, entrance \$3. The competition for the trophy was very keen, but the weather conditions were decidedly against high scores. A gale of wind blew from the north, accompanied by a heavy fall of snow, which at times rendered it almost impossible for the shooters to see the targets.

The attendance was larger than expected, considering the disadvantages of the weather and the fact that the street car strike rendered it difficult for shooters to reach the grounds.

Mr. Charles H. Barriball, a member of the Muskrat Gun Club, was a winner of the beautiful Snuff Mull, the prize going to him on a score of 41 targets out of a possible 50, from the 17yds. mark. A hardy lot of shooters faced the traps, and Mr. Barriball had the satisfaction of winning in competition with a number of the best target shots in Chicago.

Several sweepstakes were indulged in, and shooters were reluctant to leave the grounds until the last moment had expired to get them home in time to enjoy their Thanksgiving turkeys.

The following are the scores in the trophy event: Willard (20) 37, Roll (20) 34, Vietmeyer (20) 29, W. D. Stannard (20) 37, O'Brien (18) 35, D. Morton (18) 32, Barriball (17) 41, Deal (17) 34, Antoine (17) 37, A. W. Morton (16) 29, Weber (16) 27, C. Johnston (16) 26, Franklin (16) 33, Parker (16) 35, Myrick (18) 34, C. Bellman (17) 40, A. A. Walters (16) 29.

Richmond Gun Club.

CONCORD, S. I., Nov. 26.—There was a strong competition at the shoot of the Richmond Gun Club.

The next shoot for the cup will take place on Christmas Day. All the prize events were handicaps.

Turkeys were won respectively as follows: Hopkins in event 7; Schoverling in event 8; Keppler in event 9; Crystal in event 3; Bechtel in event 6.

The holiday cup shoot for members only, handicap, 25 targets, was won by Bechtel. The scores were: Bechtel (3) 24, Schoverling (0) 23, Siemer (7) 21, Keppler (13) 19, Crystal (6) 17, Albrecht (0) 12, Schoen (4) 11.

The scores in other events follow:

Events:	1	2	3	4	5	6	7	8	9	10

Aqu'dneck Gun Club.

NEWPORT, R. I.—Despite the low temperature and biting wind prevailing, the Thanksgiving Day shoot of the club was well attended, fifteen shooters participating, and all but two going through the programme. After the first four events for optional sweeps were disposed of, the handicap prize match at 50 targets was shot, with allowances of misses as breaks. In this, Coggeshall and Alexander tied on full scores of 50, the former winning the shoot-off, miss-and-out; Hammett and E. S. Peckham tying for second place with 49, the latter winning. Bowles filled third place and Mason fourth. For actual breaks for the programme, Bowles was high gun with 78, followed by Smith, Hammett, Mason, Coggeshall and Griffin. The prizes consisted of a dress suit case, silk umbrella, pipe and wallet.

Events:	1	2	3	4	5	6	7	8	Prize

Ross vs. Batjer.

Elizabeth, N. J., Nov. 26.—The live-bird match of 25 birds, \$25 a side, between Mr. Louis Batjer, the all-round sportsman of Elizabeth, and Fredk. West Ross, the fifteen-year-old son of Mr. W. E. Ross, was held on Thanksgiving morning, at Earl's, on Rahway road. As the score shows, from start to finish, Mr. Batjer was not in young Ross' class.

Ross showed excellent judgment for his first appearance at the traps, shooting in fast time with his first barrel, and taking time with the second.

An incident of this young adept's work was going to the platform with the hammers of his gun down, only discovering it when the bird was well under way. He, however, lowered his gun, cocked one barrel and killed his bird cleanly. This bird was a fast right-quartering incomer.

A sweep was then arranged, in which W. E. Ross killed 14 straight, C. H. Ross 12 straight, Fred W. Ross 9 out of 10, E. W. Browne 2 out of 6. The scores:

Trap score type—Copyright, 1903, by Forest and Stream Pub. Co.

Batjer	0	1	0	0	0	1	1	0	0	0	1	1	1	2	0	1	1	2	0	1	1	3
Ross	1	1	1	0	1	1	1	1	1	1	0	1	1	2	0	1	0	0	0	2	2	1

Cincinnati Club Members.

EMIL WERK, Chas. Gammon and some of their Chicago friends have returned from a hunt in Wisconsin. The weather was cold, 29 below, and there was considerable snow on the ground. They killed one bear and two deer, besides having some excellent duck shooting. One of the hunters wandered away from camp and was not found until the next forenoon. He was fortunate in being able to start a fire, and thus keep from freezing. When found he was about twelve miles from camp. As soon as he realized he was lost, he made his camp and waited for a rescue.

Maynard and Herman Jergens were at the grounds on Thanksgiving Day, having returned from their hunt in Lawrence county, Ill. They had excellent sport, killing all they could eat, besides supplying the neighbors, and brought home fifty quail a piece, which they distributed among their friends who could not get off.

Grandpa Winters and party had a successful trip in his launch the Little Jim. They hunted at available places along the Ohio as far as Augusta, Ky., bagging twelve mallards, seventy-seven rabbits and eleven quail. Lew Pfeiffer and several friends have returned from a hunt at Rising Sun, Ind., with ninety-one rabbits. Lew is a pretty good shot, although his friends do say he is more of an expert at diving, and can get more game.

BONASA.

New York Athletic Club.

NEW YORK, Nov. 28.—The New York Athletic Club shoot at Travers Island to-day, was well attended. Dan. I. Bradley cup, 50 targets, handicap allowances, to be won twice to become the property of the winner, had scores as follows:

H P Walker	8	28	35	G E Greiff	2	36	33
W J Elias	20	22	42	Dr. De Wolf	8	25	33
H P Walker	8	28	35	Marble	0	19	19

Other events:

TATHAM'S CHILLED SHOT

is the only kind safe to rely on to make an effective killing pattern, and it is worth while to take a little trouble to make sure you get it.

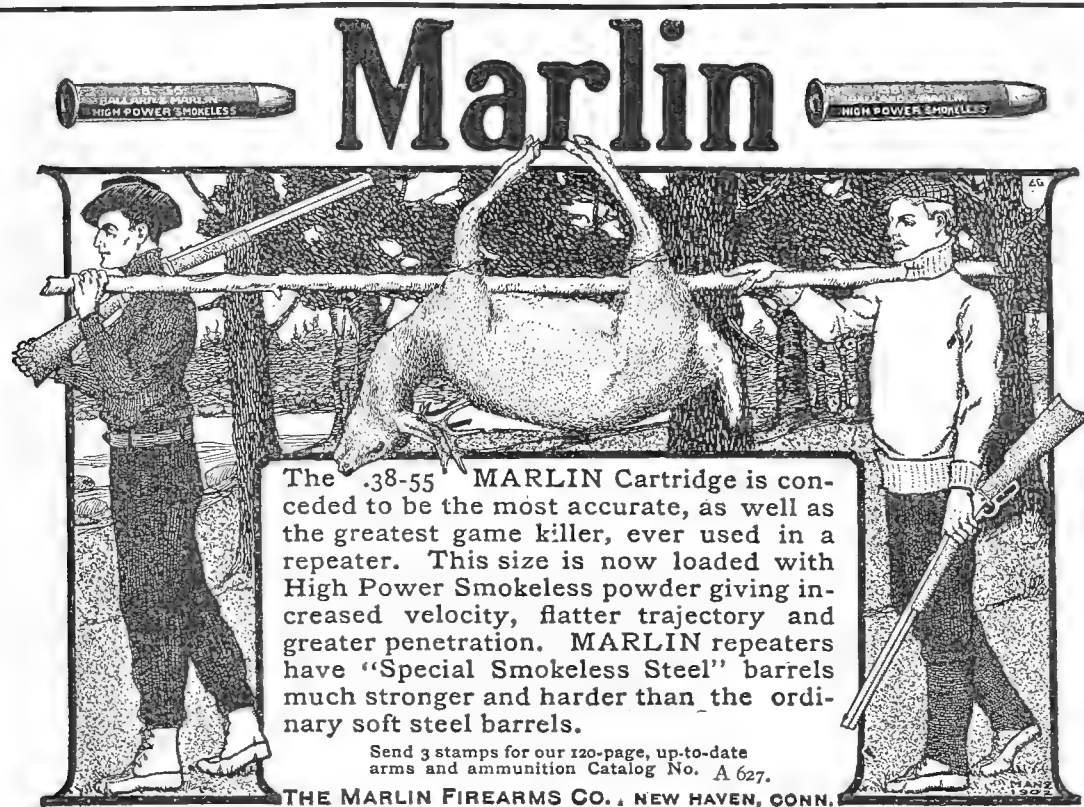

"INFALLIBLE"

At the tournament held at Raleigh, N. C., October 21, 22 and 23, High Amateur Average was won by W. P. Wittaker, of Raleigh, with a score of 314 out of a possible 355 targets.

This gentleman also won the Lyon Trophy, emblematic of the State Championship, with a score of 93 out of 100 targets. He used

Marlin

The .38-55 MARLIN Cartridge is conceded to be the most accurate, as well as the greatest game killer, ever used in a repeater. This size is now loaded with High Power Smokeless powder giving increased velocity, flatter trajectory and greater penetration. MARLIN repeaters have "Special Smokeless Steel" barrels much stronger and harder than the ordinary soft steel barrels.

HAMILTON TAKE DOWN RIFLE \$2.00

Our winter woods are full of sport for the happy owner of a Hamilton Rifle and intending buyers of Christmas presents should head their lists with a "Hamilton." Every member of the family (except the baby) can enjoy using this ideal weapon and will highly appreciate it as a Christmas gift. It is light and strong, shoots long and short 22-caliber cartridges and has automatic shell ejector. For small game and target practice it is absolutely unrivaled. Price \$2.00

Our No. 15 Model, with a four inch shorter barrel, is practically the same weapon reduced to boy's size. Price \$1.50. Ask your dealer to show you Hamilton Rifles. If he cannot, we will deliver either style by prepaid express on receipt of price. Illustrated folder—FREE.

The HAMILTON RIFLE CO., Box 65, Plymouth, Mich.

AMERICAN MADE GUNS

Cheaper than Belgian guns of the same grades.

Handle a line of guns that has no competition. Write for catalogue and prices before buying guns.

THE H. & D. FOLSOM ARMS CO., Mfrs., 314 Broadway, New York.

A second edition of the October "Game Laws in Brief" now ready, Sold everywhere.

Camping Out

Camping may be pleasant, or disagreeable, or dangerous. The equipment has all to do with it. Expense may be large and results unsatisfactory, or small with good results. The "know-how"—what to take, what to leave—has all to do with the comfort and pleasure of an outing expedition, be it to explore unexploited mountains or find the north pole, or just a month in the north woods.

Our business is to *know how*. Our success leads us to believe that we have learned our business.

We manufacture and sell everything for outfitting camping parties. Let us send our catalogue, or better still, call on us, if you contemplate "smelling burning wood before an open tent in the shadow of the woods."

TWO NEW EDITIONS.

American Duck Shooting.

BY GEORGE BIRD GRINNELL.

The unexampled success of Mr. Grinnell's book on Duck Shooting has warranted the production of two new editions, revised, enlarged and brought down to date.

One of these—in response to calls from many who had purchased the original edition—is an *edition de luxe*, printed on specially made Old Stratford deckle edged paper, the full page plates on India tinted paper, with binding of heavy buckram and gilt top. Price, \$5.00.

The other edition is uniform in appearance with the first edition, but contains the additional matter. Price, \$3.50.

This is by far the best book on American duck shooting ever published. It contains figures and descriptions of every swan, goose and duck known to America; full descriptions of all varieties of wildfowl shooting, and a great amount of information on guns, shooting, retrieving, dogs, decoys, blinds, batteries and boats. No duck shooter who wishes success can afford to be without it.

It is illustrated with eight full page plates, fifty-eight portraits of swans, geese and ducks, more than fifty vignettes in the text, and many plans of batteries, boats, etc.

FOREST AND STREAM PUBLISHING COMPANY,
346 Broadway, New York.

HOLIDAY BOOK OFFERS.

THE FOREST AND STREAM PUBLISHING CO. has long been recognized as the headquarters for all books on outdoor sports, and booksellers, as well as individuals wishing to purchase such books, come to us for the volumes which they desire.

In order to extend our range so as to cover a wider field, and to give our readers at a distance and often far from towns an opportunity to purchase without trouble books of a general character, we have made arrangements by which we are able to submit to our subscribers a larger number of general books at prices which quite defy competition, and which will not fail to appeal strongly to the reading public. These books are printed from large type on good paper, and are bound in handsome and durable, if inexpensive, cloth binding. To the man, woman or child who reads books for what they contain, they are as valuable as more elaborate volumes costing many times as much.

The first list includes more than 450 titles of standard works, embracing fiction, essays, poetry, history, travel, and exploration. In making up this list trash has been eliminated, and selections have been made of good literature, written by authors of world-wide reputation. Among them are many of the classics of English literature, together with many works translated from the best French and German authors.

Nor have we confined ourselves to literature adapted solely to adults. In the lists given below will be found many of the most popular works for girls and boys that have ever been printed in English. The boys' stories of Horatio Alger, Jr., James Otis, Harry Prentice, G. A. Henty, and the girls' stories of R. N. Carey, C. M. Young, and Fannie E. Newberry offer to boys and girls good and interesting reading for the long winter evenings, which we feel sure they will be glad to have. Especially interesting, because exciting and because true, are the patriotic historical stories, which have to do with the early events of this nation—with the struggle for liberty of our forefathers. The tales are interesting stories, but as they are historically true, they are also most instructive. The series of biographies tell of the lives of many of the most celebrated persons known. They are useful and attractive.

But it is in the sets of classics from the pens of such writers as Cooper, Blackmore, Dickens, Dumas, Geo. Eliot, Scott and others that the greatest bargains are to be had, and a little study of the lists given below will readily show how, if one has not a library he may begin one, or if he already has one, may add to it. To all persons about to send in their subscriptions for the year, whether new or renewals, THE FOREST AND STREAM offers the following opportunities:

OFFER No. 1.

Any 10 volumes, listed at \$1.....\$10
Forest and Stream for 1 year..... 4 } will be sent on receipt of \$8.

Fairy Land of Science.—Arabella B. Buckley.
Far From the Madding Crowd.—Thomas Hardy.
Faust (Goethe).—Trans. by Anna Swanwick.
Felix Holt.—George Eliot.
Fifteen Decisive Battles of the World.
File No. 113.—Emile Gaboriau.
Firm of Girdlestone.—A. Conan Doyle.
First Principles.—Herbert Spencer.
First Violin.—Jessie Fothergill.
For Faith and Freedom.—Walter Besant.
Fortunes of Nigel.—Sir Walter Scott.
Forty-Five Guardsmen.—Alexandre Dumas.
Foul Play.—Charles Reade.
Fragments of Science.—John Tyndall.
Frederick the Great and His Court.—Muhlbach.
French Revolution.—Thomas Carlyle.
From the Earth to the Moon.—Jules Verne.
Gascoyne the Sandalwood Trader.—Ballantyne.
Gil Blas, Adventures of.—Le Sage.
Goethe and Schiller.—Louisa Muhlbach.
Gold Bug, and Other Tales.—Edgar A. Poe.
Gold Elsie.—E. Marlitt.
Golden Galleon, The.—Robert Leighton.
Golden Treasury, The.—Francis T. Palgrave.
Goldsmith's Poems.—Oliver Goldsmith.
Good Luck.—E. Werner.
Gorilla Hunters, The.—R. M. Ballantyne.
Grandfather's Chair.—Nathaniel Hawthorne.
Gray's Poems.—Thomas Gray.
Great Expectations.—Charles Dickens.
Greek Heroes.—Charles Kingsley.
Green Mountain Boys, The.—D. P. Thompson.
Grettit the Outlaw.—S. Baring-Gould.
Grimm's Household Tales.
Grimm's Popular Tales.
Gulliver's Travels.—Dean Swift.
Guy Mannerling.—Sir Walter Scott.
Handy Andy.—Samuel Lover.
Hardy Norseman, A.—Edna Lyall.
Harold.—Bulwer-Lytton.
Harry Lorrequer.—Charles Lever.
Heart of Midlothian.—Sir Walter Scott.

Heir of Redclyffe.—Charlotte M. Yonge.
Hemans' Poems.—Mrs. Felicia Hemans.
Henry Esmond.—Wm. M. Thackeray.
Her Dearest Foe.—Mrs. Alexander.
Hereward.—Charles Kingsley.
Heriot's Choice.—Rosa N. Carey.
Heroes and Hero-Worship.—Thomas Carlyle.
Hiawatha.—H. W. Longfellow.
Hidden Hand.—Mrs. Southworth.
History of a Crime.—Victor Hugo.
History of Civilization in Europe.—Guizot.
Holmes' Poems.—Oliver Wendell Holmes.
Holy Roman Empire.—James Bryce.
Homestead on the Hillside.—Mary J. Holmes.
Homo Sum.—George Ebers.
Hood's Poems.
House of the Seven Gables.—Nath'l Hawthorne.
House of the Wolf.—Stanley J. Weyman.
How Jack Mackenzie Won His Epauettes.—Stables.
Hunchback of Notre Dame.—Victor Hugo.
Hypatia.—Charles Kingsley.
Hyperion.—Longfellow.
Iceland, Fisherman, An.—Pierre Loti.
Idle Thoughts of an Idle Fellow.—Jerome.
Iliad, The.—Pope's Translation.
Inez.—Augusta J. Evans.
Ingelow's Poems.—Jean Ingelow.
Initials, The.—Baroness Tautphoeus.
Intellectual Life, The.—Philip G. Hamerton.
In the Counsellor's House.—E. Marlitt.
In the Golden Days.—Edna Lyall.
In the Schillingcourt.—E. Marlitt.
Ishmael.—Mrs. E. D. E. N. Southworth.
It Is Never Too Late to Mend.—Charles Reade.
Ivanhoe.—Sir Walter Scott.
Jack's Courtship.—W. Clark Russel.
Jane Eyre.—Charlotte Bronte.
John Halifax, Gentleman.—Miss Mulock.
Joseph Balsamo.—Alexandre Dumas.
Joshua.—George Ebers.
Keats' Poems.—John Keats.
Kenilworth.—Sir Walter Scott.
Kidnapped.—R. L. Stevenson.
King Arthur and His Noble Knights.—MacLeod.
King's Pardon, The.—Robert Overton.
Kit and Kitty.—R. D. Blackmore.
Kith and Kin.—Jessie Fothergill.
Knickerbocker's History of New York.—Irving.
Knight Errant.—Edna Lyall.
Koran, The.—Trans. by George Sale.
Lady of the Lake.—Sir Walter Scott.
Lady With the Rubies.—E. Marlitt.
Lalla Rookh.—Thomas Moore.
Lampighter, The.—Maria S. Cummins.
Last Days of Pompeii.—Bulwer-Lytton.
Last of the Barons.—Bulwer-Lytton.
Last of the Mohicans.—James Fenimore Cooper.
Lay of the Last Minstrel.—Sir Walter Scott.
Lena Rivers.—Mary J. Holmes.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, DECEMBER 19, 1903.

VOL. LXI.—No. 25.
No. 846 BROADWAY, NEW YORK

THE CHRISTMAS NUMBER.

THE handsome Christmas number of FOREST AND STREAM has been received with unvarying favor. It has been termed artistic, substantial and worthy. The demand for it has been large, exceeding anticipation. Copies are for sale on all news stands and by dealers everywhere. If in any case it cannot be obtained, orders sent to this office will be filled.

GOOD THINGS IN STORE.

AMONG the interesting series of papers which will appear in these pages during the coming year will be the account by Raymond S. Spears of his expedition down the Mississippi River. The third of Mr. Spears' chapters will be printed next week. Another series, having special timeliness to the St. Louis Louisiana Purchase celebration, will be from the pen of George Bird Grinnell, following the "Trails of the Path-Finders," and dealing with the exploration of the early travelers in the further West. Beginning with Alexander Henry the elder, and Carver, these accounts will come down through Lewis and Clark, Henry the younger, Pike the hero of the earliest years of the last century, and many another traveler whose hardy deeds, never-failing courage, great achievements, and exciting adventures have been forgotten, along with his very name, by the busy, pushing people of to-day.

CHINOOK.

"THE Story of a Stump" by H. G. Dulong, in our Christmas number has attracted much attention, especially in the Northwest, because the inscription quoted affords an extremely interesting illustration of the quick development of a newly invented written language.

The Chinook jargon is well known to all who have traveled in northwestern America to have a wide currency, extending from the land of the Eskimo south to California, and from the Pacific Ocean east to the Rocky Mountains. It is properly termed a jargon, for it is a conventional language similar to the *Lingua Franca* of the Mediterranean, and the Pigeon English of China—a trade tongue spoken by many people and sufficient for the expression of simple ideas.

Although some persons have expressed the belief that the jargon was in use before the advent of the whites on the northwest coast, this may well enough be doubted; although it is probable that many words belonging to different tribal languages were in use among other tribes, and it is possible that there was some common tongue by which intercourse was carried on all along the coast before the coming of the whites. However, the Chinook jargon, as we know it, contains abundant internal evidence of English and French influence, and many of its words are drawn from these languages, just as many are drawn from the Chinook language and from that of the Nootka and other coast tribes. The multitude of different Indian tongues spoken along the coast greatly favored the establishment of some common speech. We are told that in 1792 Vancouver's officers who visited Gray's Harbor found that the natives there, though speaking a different language, yet understood many words of Chinook, and in the narrative of Hewitt, a captive among the Nootka in 1803, a brief vocabulary of the Nootka tongue is given which contains words now found in the jargon.

When Lewis and Clark reached the mouth of the Columbia in 1806, the Chinook jargon had become a spoken tongue, but when the Astor fur traders arrived it came into more general use, and received many additions. In this way its growth continued until the arrival of the railroad and the settlement of the country, since which time it has slowly begun to drop into disuse.

One of the most interesting developments in connection with this language is the establishment of a method of writing it. This invention is due to the energy of the French priest, Father Le Jeune, who in the year 1890 conceived the idea of adapting the Duployan system of stenography to writing the jargon. This was done at once, and it was found that the system answered perfectly well for the purpose. An Indian who saw the writing for the first time soon learned its principles, and taught other Indians. In July, 1891, a little instruction in it was given to the Shuswaps, later to the Thompson Indians, those of Douglas Lake, and other interior points, while in 1892 lessons were given to the lower Fraser and sea coast

Indians. All these people took hold of this writing with extraordinary readiness, and easily perfected themselves in the reading and writing of it. It has since spread very extensively among British Columbia Indians.

In 1891 Father Le Jeune issued the first number of a little paper written in these characters, which he called the Kamloops Wawa—the Kamloops Speaker. This periodical, written by Father Le Jeune, and by him printed on a mimeograph, has had a very considerable circulation, and has done much to diffuse a knowledge of these written characters. How generally they are in use is shown by the copy of the letter carved on a stump included by our correspondent, H. G. Dulong, in the charming Story of a Stump, already referred to.

Syllabaries of Indian tongues are not great novelties. We have the alphabet of Sequoya, the Cree syllabary invented by the missionaries of the North, and now in general use among Indians and half-breeds of the Northwest, possessing as well a very considerable printed literature. But for extraordinary character and for swiftness of adoption there is perhaps nothing quite like the written Chinook wawa. As Mr. Pilling well says, "Written in an international language, 'set up' in stenographic characters, and printed on a mimeograph by its inventor, editor, reporter and publisher all in one, this little weekly seems to leave nothing in the way of novelty to be desired."

GAME POSSESSION IN LOUISIANA.

WE print elsewhere a recent decision of Judge Baker of the New Orleans District Court in the case of a hotel proprietor who was under prosecution for the possession of venison in close time. The decision is interesting as an illustration of the extent to which one with a preconceived opinion may find in the wording of the law something diametrically opposed to the meaning which another may find in the same language. In this instance, Judge Baker reads the statute to confirm his notion of the intent of the Legislature, which he expresses in these words:

"I imagine it would be difficult to find a statute which makes, or undertakes to make, the possession alone of property which has a legitimate use in and of itself a crime. Ordinarily, when possession is made criminal it is made so because the possession is wrongfully obtained, or the property had in possession is intended for some wrongful purpose. * * * Believing as I do that the possession of deer during the prohibited season can only be unlawful when the killing or taking was unlawful, the judgment herein rendered must be set aside."

As a matter of fact there is not the slightest difficulty in finding "a statute which makes the possession alone of property which has a legitimate use in and of itself a crime," that is to say, a misdemeanor. The game laws of the country at large do this very thing. It is the prevailing principle that the possession of game in close season is prohibited and made a misdemeanor. Game is "property" of a certain nature "which has a legitimate use," and the possession of it is forbidden without respect to whether it was "wrongfully obtained." Judge Parker appears altogether to have missed a recognition of this common element in our game protective system. Prohibition of possession in close time is essential for two purposes; the first to prevent the killing in the close season, and the second to prevent the excessive slaughter in open season for marketing in close season. The game supply of Louisiana, like the supply of the rest of the country, could not stand the drain of killing for unrestricted possession and sale in the close time; nor is the executive system of the State so perfect that it could enforce the law against killing in close season were there no restriction on possession in close season. It is reasonable to assume that the Legislature intended to adopt the system elsewhere in force and by statute to confine the possession of game to the period open for the taking of it. And, indeed, the law as quoted by Judge Baker himself does thus explicitly forbid possession in close time.

Section 1 provides that it shall be unlawful to have any deer in possession except as hereinafter provided.

The "hereinafter provided" exception is given in Section 2, which names an open season for killing deer.

Section 5 provides that it shall be unlawful to have any game in possession "within the period during which they are intended to be protected by the provisions of this act." The period during which they are intended to be

protected is specified in Section 1. It is all the time except during the open season provided in Section 2. That is to say, they may be possessed only in the open season; they may not be possessed in the close season.

The Audubon Society would do well to appeal the case.

MONEY BY MAIL.

THE season of holiday buying accentuates the very common inconvenience of sending money by mail. This is often so great as actually to discourage a prospective purchaser, who would send for the desired article were the transmission of money simple and convenient. We estimate that the mail-order book business of the FOREST AND STREAM would be very much greater were the sending of money by mail practically as ready and simple as the handing of money over a counter. One transaction should be no more inconvenient than the other. A buyer should be enabled to do business at a distance directly without going to the post-office for a money order or to the bank for a draft.

We have alluded before to the work of the Post Check Currency Bureau, which is making an organized effort to secure action by Congress which will provide a system of check currency by which the currency in every day use may be converted into checks for safe transmission to the e.

The measure now before Congress is H. R. 1976, introduced Nov. 12, by Mr. Gardner, of Michigan. It provides in brief that paper currency of the denominations of one, two and five dollars shall have upon the face of the note suitable blank spaces, in which the holder may write his own name and the name of a payee; and the note thus filled out and stamped with a two-cent postage becomes thereupon a check payable only to the person or firm designated, and may be sent through the mails with perfect security. When receipted by the payee it may be cashed at any money-order office, or may go through the banks for ultimate return to the Treasury for cancellation. To illustrate the working of the scheme: A subscriber wishing to send the subscription price of FOREST AND STREAM would take two two-dollar notes and write upon the face in the blanks provided his own name and the name of the Forest and Stream Publishing Company, affix a two-cent stamp to each bill and mail them. Upon receipt, the Forest and Stream Publishing Company would affix its signature in the spaces provided and deposit the notes in the bank.

The system is admirable in simplicity and safety. The adoption of it by Congress would facilitate trade to an extent incalculable. Public interest in securing the post currency system should be given such expression as will prompt action by Congress.

THE probability is that when the Mayor of Freeport, Ill., and his friends started out on a deer hunting expedition in the wilds of Wisconsin, they had not the slightest intention of providing venison for the inmates of the Wisconsin State Hospital for the Insane. On the contrary, it was their purpose to bring the game home for their own tables and those of their friends. To this end they took the precautions and adopted the expedients known to visiting sportsmen intent upon violating the export laws of the State in which they are hunting. The venison was carefully packed in trunks and the trunks were then checked through to the Illinois destination. All would have gone well but for the unseemly conduct of the game warden. That individual, as the Mayor of Freeport explained to the Governor of Wisconsin, was "unduly active and over-officious;" very disagreeable traits of a game warden, it must be confessed, when one is trying to sneak his game out of the State. As for the unfortunate Mayor, the warden's over-officiousness threw the fat into the fire; that is to say, diverted the trunked venison from its way to Freeport and landed it in the Hospital for the Insane. There may the chaplain say grace over it with good heart. The Mayor, bereft of guns, dogs, venison and honor, has perhaps already said about this piece of meat something else which was neither the giving of thanks nor the invocation of a blessing.

THE FOREST AND STREAM of January 2, the New Year number, will contain a colored supplement printed in twelve colors.

The Sportsman Tourist.

Maine Woods Songs.

Most of them are unwritten—the songs of the Maine lumber camps. The words have been passed down by word of mouth like the tales of the desert Bedouins and the love songs lilted at night beside the camp-fires in the East.

The vocalists among the Maine woodsmen have but tune—a sighing, melancholy monotone like the purr of the night wind in the pines. Those who have understanding in such matters say that this universal tune and its slight variations are borrowed from the early English melodies. For that matter, some of the songs that are now sung in the far woods are in their wording corruptions of some of the old English ballads. The woodsmen will tell one that so far back as the memory of man runs in the woods these camp songs have not been put to paper. Therefore, so far as these rugged songsters of the North are concerned, their songs have come from lip to lip all the way down from the ancestors, who brought the words across the sea.

The sportsmen who throng the Maine woods in the hunting season make a practice of seeking out lumber camps in order to spend an evening at the hearthside and listen to these quaint old ballads. Half the charm is in the surroundings and the methods of the singers.

The snapping fire in the big room of the camp, flashing its eerie light on the faces of the "deacon-seat" crowd, the dancing flickers on the low-sloping rafters, blue wreaths from the pipe bowls curling lazily among the larrigans and leggings hung to dry, the board bunks filled with their spicy boughs of spruce and hemlock, and the deep, dark forest around with its thrills of sound and its sighing trees—all these are the necessary concomitants for a due appreciation of a camp song sung by a woodsman.

And then the manner of singing!

"Wal, Pete," the boss will say, after quacking briskly at his pipe stem to get his tobacco alight, "How's your voice to-night?"

The woods camp songster is always backward.

"All sung out," growls Pete.

"Here, cookee," bawls the boss, "bring Pete a handful of canary bird seed and a hunk of cuttlefish. We want some music."

A bellow of laughter from the deacon-seat greets this well-worn woods joke, and Pete grunts in answer to the chaffing. But at last the chorus of appeals stirs his phlegm. He knocks his pipe against his heel, scruffs his toil-stained hand through his shaggy locks as though in an effort to dig up ideas and scowls reflectively.

"Can't think of anything new," he grumbles.

"We don't want anything new," shouts the boss. "It's only city dudes that want a new tune every time they turn around. It takes fifty years to make a tune pop'lar in the woods," he explains to the stranger who may be within the gates for the evening.

"Give us the old Lake Chemo one," is a request from the dark corner where one lolls in his bunk kicking his moccasins idly over the side.

So Pete, thus adjured, crosses one leg over the other, leans forward on his elbows and beating time with cocked-up toe, lifts up his voice.

"I left old Lake Chemo a long way behind me,
When with many a tear back to Old Town I came;
But if ever I live just a year from this August,
I'll pack up my traps for old Chemo again,
Where the pick'rel are plenty, the perch in abundance,
And whisky and new milk they both flow like rain;
And if I but live till a year from this August,
I'll pack up my traps for Lake Chemo again."

There are many other verses devoted to the extolling of Lake Chemo, and the good things to be enjoyed there, and the audience listens with as much avidity as though it heard the song for the first time. And when the singer suddenly breaks from his sighing melody and recites the last line in cold, calm, matter-of-fact recitative as a signal that this is the end, the applause is uproarious.

That universal method of ending a woods song produces a peculiar effect on one who listens for the first time. It is a sort of anti-climax, as it were, like a douche of cold water, but no singer ever thinks of varying the style.

With Pete once started, there is no trouble in getting him to sing another song. Usually his next one is a lilt with a chorus. He carries on the burden of the ballad—usually some narrative, and his fellows come in on the chorus with all the vigor of two score pairs of lungs.

The old woods favorite, The Bold Baker of Banbury Town, is sung many times in the course of the winter. Old men who were in the Maine lumber camps seventy-five years ago, say that it was sung with as much zest then.

Here are two of the dozen or more stanzas which, with the chorus, consume a very respectable amount of time:

"There was a bold baker of Banbury Town,"

And now all the men together as loud as they can bawl:

"Sing whoop, fa la larry, ling darry, sing torry lo day!
And the baker to Mansfield market was bound,
Sing whoop, fa la larry lo day!
He harnessed his boss and he piled on his load,
And away to Mansfield market he rode,
Sing whoop, fa la larry lo day!"

"He hardly had got two miles on his way,
Sing whoop, fa la larry, ling, darry, sing torry lo day!
When he espied three devils at play,
Sing whoop, fa la larry lo day!
'Says they, 'Master Baker, can you tell us that,
And that's what makes your boss look so fat?'
Sing whoop, fa la larry lo day!"

Sometimes in the deep woods when the men are chopping, one will start this song, and from all round

among the trees the others will come in on the chorus with an inspiring effect that drives startled deer and wandering bob cats far to the depths of the forest.

There is almost always in all crews one song addressed to a good cook and his willing cookee, or helper. While the men are smoking and digesting their suppers, and the cook and cookee are hustling about their work in the dingle, scrubbing the supper tins, the crew will break out into some such clamorous laudation as this, the persons thus addressed flushing self-consciously and grinning half shamefacedly:

"Perhaps there are cooks who in slappin' up grub,
Have got eddication clear up to the nub.
There are cooks for the rich men and cooks for the queens
But here's to our cooks of the pork and the beans,
Sing hey foo loo lap tarr, O!
Go hunt where ye will, on the land or the sea,
Ye'll find none to wrasse our cook and cookee."

"They're up at the peep o' day, early about
With their grub on the table. Turn out, boys! Turn out!
They boost up the sun and they pry off the lid
Of the old iron pot where the beans have been hid.
Sing hey foo loo lap tarr, O!
Go hunt where ye will, on the land or the sea,
Ye'll find none to wrasse our cook and cookee."

These are some of the more cheerful songs. But lumbermen are as superstitious as sailors. For instance, there is a camp up on the Soudnaheunk waters that is reputed to be haunted. It is said that it was built on a man's grave, and those who have been hardy enough to sleep in it alone aver that most extraordinary noises are heard there. Years ago some unknown woods composer evolved this song that ever since has had more or less vogue in the camps at night, especially when there is a storm abroad, and the woodsmen feel like harassing their own feelings:

"O, I went, boys, I went to old Jumper Joe's grave,
Clank, chank your chains, you old devil, you!
Says he, 'Boost me up from hell-fire to save,'
Clank, chank your chains, old Joe.
"He rattled underneath, and he rattled overhead,
Whew! smell the brimstone down there below!
I did not darst to lie down in that bed,
Where they laid out old Joe."

There are many songs that commemorate the achievements of the old-time lumber operators and employers in the Penobscot region. Of these it is related that John Ross, when he wanted men for his crews and wanted them in a hurry, would fairly lug them away with him into the woods. There is a song that relates the perils of the drive along o' John Ross, and starts in as follows:

"The first night I was married, and was lying in my bed,
Up steps John Ross, that lumberman, and stood at my bed-head
Sayin' 'Rise, arise, young married man, and come along with me,
For the wild woods of Chesuncook for to drive those logs so free."

These are, of course, but scraps and snatches, but they give a bit of an idea of the unconventional nature of these lyrics of the camps. No conception of the music, always picturesquely characteristic and sometimes weird, can be afforded.

Perhaps there is no woods song more widely known in northern Maine than the crude ballad that was the swan song of one Peter Amberly. He was a chopper in an Aroostook camp, and the circumstances under which the song was written make the lines peculiarly pathetic.

Amberly was an eighteen-year-old boy, a quiet, well-mannered young fellow who is remembered by some of the older lumbermen of Maine.

He had been driven from home by the severity of his father and came into Maine from his home in the Provinces. Amberly was crushed by falling logs while he was helping to load a sled. He lived two or three days after the accident, receiving only such rough nursing as the cook could give between his duties. While lying in his bunk awaiting death, Amberly composed some verses and left a request that they be sent home to his mother. The poor screed was forwarded, but the pathos of the affair was very close to the hearts of the woodsmen, and since that time the lines have been sung in all the camps between West Branch and the Allegash. The music is full of long-drawn notes and queer quavers. Here is the fashion in which the ballad starts off:

"My name is Peter Amberly, as you may understand;
I was born in Prince Edward's island, near by the ocean's strand.
I hired to work in the lumber woods, where the logs come crush-

ing down,
And in loading sleds from a high-piled yard I received my mortal wound.

There's danger on the dashing sea when angry waves run high,
There's danger on the battlefield when screaming bullets fly,
There's danger, too, in the lumber woods, and death stalks solemn there,

And I have fallen a victim now into the monster's snare.
Here's adieu unto my father, it was he who drove me here;
He was always harsh toward me, his treatment was severe.
Here's adieu unto my better friend, my mother sweet and fair,
She reared a son who fell as soon as he left her tender care.
Here's adieu unto my younger friends and my island girl so true,
Long may they live to grace the soil where my first breath I drew.

Here's adieu to Prince Edward's Island, that garden in the seas,
No more I'll roam its sunny banks and drink the summer breeze.
Near to the city of Boisetown my mouldering bones will lay,
Forever there neglected until the Judgment Day."

This composition is crude, to be sure, but its sincerity and the circumstances under which it was written make it one of the most pathetic bits of folklore in the Maine woods. It is the wail of a homesick boy dying far from home and those who loved him, with only the rough hands of woodsmen to ease his pillow. Such verse is not to be judged by the cold standard of metrical composition.

Sportsmen from town who have heard these ditties when they have been sung in the proper surroundings and by the woodsmen themselves, have carried away a memory of the forest both piquant and lasting.

HOLMAN F. DAY.

AUBURN, Me.

Back-Trailing Horses.

Editor Forest and Stream:

Emerson Carney's notes as to horses following the back trail remind me of an interesting ride I had last summer in the Rocky Mountains.

Our camp was on Swift Current River, near the St. Mary's lakes, which are located in the northwestern part of Montana. We left camp early one morning to ride to the glacier at head of the south fork of Swift Current, which is reached by crossing the Continental Divide and going to the west side of the range. I was mounted on the Abbot, a light bay delicately built Indian pony that had at one time been a race horse. He was fleet of foot, ambitious, and always wanted to be in the lead.

We rode up the middle fork of Swift Current, following a plain open trail until we reached the heavy timber, where we turned off on a blazed trail. This led along through the pines with Swift Current and a high mountain on our left while on our right was Mount Wilbur, with many streams running down its sides and emptying in the river on our left.

We forded these as we came to them; then we passed on through the forest, stepping over fallen timber and winding in and out through and past the lodge pole pines, balsam and other trees.

Presently the man in the lead turned his horse toward an opening in the trees and we followed. To the uninitiated this opening would have meant nothing and would have been passed unnoticed, but we were now on an old Kootenai game trail. This we followed much in the same way, through streams and among the tall straight pines, with the mountains towering above us on either side.

Then we came to a more open place where grew tall grass and many beautiful flowers. In front of us and in the distance was the great wall of rock over which we were to pass. It seemed a continuation of the tremendous mountains on either hand, and showed no break or opening through which we might pass. We were no longer in the timber. There were scattering pines in the valley. Above us on the drifts high upon the mountain sides we could see the tracks of goats, making long lines on the snow. Our course bore to the left as we followed the range.

As we approached the very head of the valley we turned to the left, and then, rounding a point of the mountain, to the right, and there the trail began to climb. From here on, the way was hard. Soon we were obliged to dismount and lead our horses. Even this was difficult, as the ascent was so steep and winding that the horses began to crowd on each other, and it seemed that one might be pushed off the narrow trail at any moment and roll down the mountain. This did not happen, but after great efforts we finally reached the top—the continental divide looking toward the Pacific.

The climb on foot to the glacier occupied most of the day, so that when we got back to our horses we had only time to build a fire and make some chocolate, for if we did not get down the divide before dark we should have to spend the night on the mountain. It was with great difficulty that we got down.

The snow over which we had to pass seemed harder than when we came up, so that the horses slipped and floundered and could hardly keep their feet. The light began to fade, the wind blew, and the air was cold. The waterfalls which surrounded us on every side seemed louder and more threatening than earlier in the day. Our horses slipped and slid and stumbled, but we finally reached the bottom just as it was growing dark.

It was here that Jack Monroe said, "You and Abbot may lead the outfit if you like." The Abbot seemed to understand the words. As I turned him toward the camp his ears pricked and he led off with a vigor and understanding which were unmistakable. He was so quick that the last of the party were hardly off the mountain before we were well on the trail. To be alone with one's horse and he taking you through a wild and unknown country with mountains towering on every side, brings to one a comprehension of the intelligence and fidelity of the dumb beast. As we were passing along through some heavy underbrush with nothing to show that we had gone that way before, the Abbot shied to one side and a large dark animal was seen ahead of us in the lowering light. I was not afraid of the porcupine, but my legs clung tighter to the Abbot's sides as we then plunged into a dense black hole and were in the forest. My reins hung loose over the horse's neck, and I let him go where he would. It was so dark that I could distinguish little as I looked ahead while the Abbot swung along with perfect confidence. We came to streams and he plunged into them, scrambling up on the opposite bank, winding his way in and out between the trees. The others of the party followed close at our heels. The Abbot's swiftness would have left them behind had I not checked him and waited so that we might all keep together and no one get lost. He seemed always to be on the alert, sometimes turning his head to one side.

We came to one stream that had grown higher and more threatening since our crossing in the morning, but I trusted to the Abbot and he carried me over, although from the great depth of the stream I was confident that we were wrong. Only once he seemed to leave the trail, and then he showed his own good judgment in going around a place which was wet and deep with mud.

We had many miles to go through the forest, which was so black, mysterious, and silent, save for the sound of the falling water and the voices of our own party.

I strained my eyes for possible sign or moving object, but saw none. The only thing that relieved the intense blackness were the tall flowered heads of the soap weed which grew in little openings and which looked ghost-like as we passed along. The Abbot finally brought us out of the forest.

We then rode along Swift Current down to our camp. When we got out in the open country and the other horses came alongside, I felt they all owed the Abbot a great debt of thanks.

At another time the same horse brought me back to camp, but it was daylight, and at times I could see the tracks made in going out, so I knew that we were on the trail. Back-trailing, I believe, is a trait not found in all horses to the same degree.

When one finds a horse to whom he can trust his life, do you wonder in such a country as the West, where one

Natural History.

Substitutes for the Hand.

THE uses of the human hand are various, the chief of which is as the organ of touch and of prehension. The sense of feeling is distributed all over the body; but in examining any substance by touching it we use the ends of the fingers. It is there that this delicate sense is primarily placed. So, too, in seizing and holding any object we employ the hand.

In the lower creation we find in some animals organs that are used for the same purposes, those most nearly approaching the human hand both as a tactual and a prehensile instrument being the proboscis of the elephant and the paws of the monkey. The latter creature also has a powerful means of "holding on" in his prehensile tail, which convenience he shares to some extent with the opossum, and which in human circles is rivaled only by the persistence of the man who is waiting around for a Presidential appointment.

Something akin to the delicacy of touch, as it exists in the ends of the fingers in the human hand, we find, we say, in various organs in the lower creation. To these lower animals it is as important as it is to man, as it is as vital to their well being as it is to his. In the cat, for instance, how exquisitely delicate is the sense of touch as it exists in the extreme ends of Tabby's "whiskers." Every individual bristle is as sensitive to touch as is the electrode to the influence of the magnetic current. "The cat," says an old writer, "stealing along in darkness, in order to invade the pigeon-loft or chicken-pen, is materially aided by these organs, which communicate an impression from the slightest contact with any object. They enable it to creep through crevices without running foul of any impediment, or to steal through tangled brushwood upon the bird or the leveret, and thus combine with the power of nocturnal vision, and its springy feet, well armed for destruction, to fit it for its insidious habits." This extreme sensitiveness of the cat's whiskers is peculiar to all her tribe, and serves the same purpose in all in pursuing their prey through the thickets and jungles as in honest puss when on her way to the pigeon-loft or the chicken-pen.

The antennæ of certain insects answer the same purpose as the whiskers of the feline race. Speaking of these antennæ, Bingley, in his *Natural History* observes, "These instruments, of apparently exquisite sensibility, appear adapted to very different purposes, but to purposes with which we may remain long unacquainted." Whatever different purposes they may be adapted to, may, as he says, long remain a secret; yet anyone that has observed an insect reaching out his long antennæ and groping about with them as if in quest of information as to his whereabouts, can have no doubt that one purpose in their construction was that they might be the organs of touch in those small creatures.

In some animals this organ is very imperfect, and unless it is made up to them in some way of which we know nothing, their knowledge of objects around them, so far as knowledge is to be gained by this sense, must be very limited. In the hog, for example, the sense of touch seems to reside in the end of the snout; in the dog and the mole, in the end of the nose; in the giraffe, in the long flexible upper lip; in birds, in the bill; and in some other creatures, if this sense exists in them at all, it is perhaps only in the tongue.

The monkey's fore paw most resembles the human hand both in its shape, its situation, and its general adaptation to use; but it falls far below the latter in efficiency, mainly for want of a true thumb. "If we vigorously scrutinize the hands of the ape tribe," says the author of "Structure in Animals," "we shall soon perceive that they are instruments for grasping rather than organs structurally adapted for tact and nice manipulation. In all the thumb is short and feeble; in none is it a fair antagonist to the fingers, though in some species it is better developed than in others."

Of all these appliances the proboscis of the elephant is the most remarkable substitute for the human hand and arm. Its wonderful flexibility and strength, its extreme sensitiveness as an organ of touch, and its power of manipulation by which it is able to crush the body of a lion or to pick up a pin from the floor, constitute it, as Bingley says, "one of the most useful and extraordinary instruments that the wisdom of Providence has bestowed on any species of animal." T. J. CHAPMAN.

Thoreau as a Naturalist.

HENRY D. THOREAU had a wonderful gift not only as an observer of nature in her fields and forests, but that rare faculty of describing truthfully and vividly the habits and language of her wild children. Although he hunted without a gun, neither bird, beast, plant, or flower escaped his keen search, and his descriptions will appeal to every true sportsman and close observer of nature. In this respect he was a leader and not a follower nor imitator of others. Our most gifted and brilliant writers and observers of nature, such as John Burroughs, C. C. Abbott, William Hamilton Gibson, Bradford Torrey, Ernest Ingersoll, Frank Bolles, Rowland E. Robinson, Ernest Thompson Seton, and many others, make quotations from his original descriptions, a few of which will speak for themselves:

"The bluebird carries the sky on his back and the earth on his breast."

"The woodchuck resembles a piece of rusty iron in the grass."

He says the carrion flower reminds him of a dead rat in the wall.

Again he speaks of the woods in autumn: "What wholesome drinks are in the swamps now; the rain falling on dried herbs and leaves and filling the pools and ditches into which they have dropped will soon convert them into green, black, brown, and yellow tea of all degrees of strength, enough to set all nature gossiping."

His description of the red squirrel is amusing. In the winter he threw out corn from his cabin at Walden on to the snow for them. He says: "One would come running out on the snow crust by fits and starts, like a leaf

blown by the wind, a few paces this way and then a few paces that way, wasting more time than it would have taken to reach the corn, when suddenly, before you could say Jack Robinson, he would be in the top of a pine tree winding up his clock and chiding all imaginary spectators, and talking to all the universe at the same time."

He speaks of the owl as "the winged brother of the cat." He says, "If I were awakened from a deep sleep I would know which side of the meridian the sun might be by the aspect of nature and the chirp of the crickets. Though no painter could paint the difference, the landscape has a thousand dials which indicate the natural division of time; shadows of a thousand styles point to the hour."

Again he says, "The wood thrush pitches his flute notes in the pine alleys where at twilight is heard the strange prophecy of the whippoorwill. The ovenbird beats his brass whichever-whicher in the heated shades of noon, mixed with the feathery roll call of the partridge."

Who but Thoreau would describe the drumming of the partridge as a feathery roll call? It is also true that the metallic notes of the ovenbird are the loudest and sharpest in the noontide heat.

Much has been written of Thoreau; many have tried to imitate him, but none have equaled the great philosopher of our fields and forests. He took pride in his poverty of money, and tried to impress on others the fact that there were other kinds of poverty much worse than the poverty of money.

One of his old friends remarked as he stood looking at the old bed on which he died: "Thoreau was ostentatiously poor." While he lived his writings were very little sought for, but in the few decades that have passed since he died, there has been a great demand for his works.

There is enough in his journals of the seasons, spring, summer, autumn, and winter, to make his name famous, and to-day no well conducted library is without his books, and as the days go by the demand will continue to increase. GEO. L. BROWN.

Seaboard Air Line.—X.

May 15 to Nov. 15, 1903.

FROM May to November is a far cry in the life of a bird. Many sweet voices that made our outside world bright, as they rang among the blooms at nesting time, are now adding their charm to round out the romance of "old days" that still lingers about many a southern homestead. One can imagine the delighted whispering that stirs the trailing fronds of Spanish moss, as the signal comes, "the birds are here, arrived last night, watch out," and soon their forms are seen among the live oaks, and gums, brightening the quiet of the old trees into new life, flinging crisp fragments of northern melody on the still air, just to flaunt the mockingbirds and cardinals. The long draught of our early spring seemed to make very little difference in the traveling arrangements of the migrating hosts. Orioles arrived on May 12, and the 18th furnished a rare musical treat, in the form of a rhapsody by a gorgeous rose-breasted grosbeak, that warbled with exquisite abandon while gleaming among the viroes, who always seem to find rich forage about the oak trees. On the 20th scarlet tanagers appeared, the gleam of their brilliant plumage emphasizing their every movement amid the tender green foliage that glistened from over-night showers (the first in many weeks). Robins nested in unusual numbers and all our residents were successful in rearing their young, as there were no sharp squalls to upset their domestic economy, or hurl their fledglings to destruction. English sparrows also produced an enormous crop, owing to the absence of stormy weather. I never walk abroad after a heavy rain at nesting time, when the paths are dotted with the little naked dead bodies of these drowned out Britishers without thinking of the remark of a bright young miss of my acquaintance, "pickled mussels" she called them, and the gleaming yellow gills of the poor little sodden bodies certainly give a "pickled mussel" effect as the eye first lights upon them. All our residents took advantage of the specially favorable season to rear large families, and bird life abounded everywhere about us all through the summer days.

As to the through travel on the "Air Line," it was (as per my last report) heavy during April, reaching its culmination the first week in May. The return tide has been markedly greater than for many years past. I have the unusual note of a flock of wood duck that whirled about the old-time haunts of their ancestors for a few days in late October. Woodcock have also dropped in on us, and a sturdy specimen startled me on Election Day as he whistled up from a brier tangle that edged my path. All through the golden days of this superb autumn weather the birds have been moving—myriads of all kinds—and the end is not yet, for many members of the thrush family are still rustling the fallen leaves in sheltered copses, or gleaming among the forgotten berries of the dogwoods. *The shep! shep! shep! shep!* of the fox-sparrow resounds through the still air of the quiet woods, and one may catch many a charming glimpse of rufous coats and gleaming small clothes as these alert birds zigzag about the undergrowth just ahead. As they always keep together, one has a fine opportunity to view them as he walks along, their pretty colors contrasting beautifully with the yellows and browns of the fallen leaves. Wild ducks have gone over in fair numbers, though I have seen but few geese as yet. I wonder why writers and artists will always insist in describing and depicting the flight of wild geese in V formation. The fact is, I believe, that this V-shaped flock makes such a striking picture in the heavens, as the honking squadrons come and go, that people and casual observers in general have come to believe that wild geese always fly thus.

While the fish hawk family is always well represented along the Jersey coast, I found them much more in evidence the past season than in many years. Terns, too, were fairly numerous. I saw hundreds of them on each occasion when I went outside to view the "troubles of Shamrock," but they kept aloof at such distances that I could not identify them.

Speaking of terns, I had the pleasure of a pleasant

has to trust all to the horse, that a great affection is felt between man and beast?

A summer spent in such riding makes riding in Central Park on one's return seem very tame. E. C. G.

NEW YORK.

Texas Bad Men.

Editor *Forest and Stream*:

Tom Gilchrist in his catalogue of the bad men of Texas mentions Tom Smith among them. If this is the Tom Smith that I knew, and I think he is, I and he had something to do with keeping "bad men" (in their minds) in order many years ago.

He had entered the Confederate army when only 17 years old in 1861, and had staid in it until "the break up," then coming home, the military governor of Texas had appointed him sheriff of Fayette county, and I acted as his deputy, the only one he had.

The citizens in this county then were still divided into two parties, Union and Confederate, and these again were split up into parties who had private feuds among them. Nearly every man was on the watch to get a drop on some other man, and all went armed; but I would only have to hold up my hand and say, "Gentleman, I command you in the name of the Commonwealth of Texas," to stop a row at any time. The sheriff was a far younger man than I was, and he looked still younger than he was, but he could keep these bad men in good order.

The bad man who gave us the most trouble for a while called himself "Major." He had been in the army (most of these young men had), and he may have been a Major. He informed us that he had not surrendered yet, and never would, either. I did not care whether he did or not as long as he obeyed the law; and we were here to help him to do that, I told him.

He always wore a fancy velvet coat and a Mexican sombrero, and rode a splendid horse. He made a practice of coming into Lagrange every Saturday, filling up with whisky, then "shooting niggers," as he called it. He never really shot any, and did not try to, of course; but he would scare every negro he met half to death.

The sheriff and I were standing in the barroom of the only hotel in town one afternoon, waiting for something to turn up (neither of us would ever take a second drink here, although a dozen of men would want to "set them up"), when the Major was heard from. He was emptying his pistol—at nothing, probably—away down the street near the river.

"I'll stop this right now," the sheriff told me, and he and I ran out just as the Major came past at a gallop.

I caught hold of his bridle and the horse stopped. The Major had been riding him with the reins lying on the horse's neck; if some one had not already been run over the horse should be given the credit for it.

I had my pistol out and had the hammer up. I had formed an opinion long since that the Major's mouth was the most dangerous part of him, but was not taking any chances.

"Light down here," the sheriff commanded, and the Major got off his horse.

"Give me your pistol," he was next told, and he handed the sheriff his pistol.

"Now, you get out of town, and stay out of it," the sheriff said, "if you want this pistol send in on Monday and get it, but you keep out of this hereafter."

He never sent after his pistol, and the next time we arrested him was out in the country on a ball room floor.

The sheriff had a warrant for him that someone had gout out on an old charge, and had only now made up his mind to push it. The Major had obeyed orders and kept out of town, but he sent the sheriff word that if he tried to serve that warrant the Major would shoot him. We heard of this ball out at a planter's house and concluded to serve the warrant there. The Major was certain to be there; he could not miss a dance.

I proposed to get two men out of our troop to help us if we needed help; the Major was not dangerous, but his friends might be.

I got the men, and starting after dark we rode out to this house, leaving the two men and our horses in a creek bottom a few hundred yards from the house, the sheriff saying that we would not need the men. Then we walked up to the house. The ball was in full blast, with the whole house lit up. The dancing was in a lower room, which had both a front and a back door. I left the sheriff at the front door and went to the back door, then pushing it open went in just as the sheriff entered through the other door. The Major was in a set on the floor with his pistol on; he had got another pistol, it seemed. He saw the sheriff before he did me, and his hand went down for his pistol.

"Keep your hand off that gun," I told him. "Get your hands up," and I walked over to him with my pistol pointed at him.

"I quit," he told me, holding up his hands, while the sheriff took his pistol, the Major telling him that this made two "guns" now the sheriff would owe him.

Had this happened up in the North, the women—there was a whole room full of them—would the half of them have been screaming now, while the rest would be fainting. There was none of that here, though. The most of these women were lying flat on the floor to escape any stray balls that might be flying around. We led the Major out past his friends, most of them were armed, but none of them interfered; then a negro boy brought him his horse, and he leading him we went down to where ours had been left. When the Major saw my two men he wanted to know where the rest of the troop was. "At home," I told him, "I have all I need of them here; in fact, two that I don't need. Now, Major, I have asked Tom not to handcuff you, and he won't; but you have been a soldier, you know what will happen if you try any monkey business with us." He would not; he would get out on a bond to-morrow, he thought. He did not, though. CABIA BLANCO.

All communications for *Forest and Stream* must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

half hour with Curator Beebe at the New York Zoological Park, August 26, inspecting some baby terns and gulls just received from Cobbs Island, Virginia. There was one baby gull (skimmer) whose hold on life appeared to be very slight. Our beautiful terns have been so ruthlessly slaughtered by the plume hunters as to have almost disappeared in some sections of our Virginia coast waters. But there is hope at last a remnant may survive to gladden the hearts and charm the eyes of future generations, thanks to the efforts of William Dutcher, Audubon Societies, et al.

Have you ever risen before the sun on some crisp October morning and seen the migrating hosts of robins, far, far in the clear blue sky, mere specks, till suddenly every tiny red breast is touched by a sun-ray and glistens faintly, though clearly, as a spark flares up? Have you heard the far away *t'seep! t'seep!* of their happy voices? It is a fairyland effect, and only seen in these golden autumn days, when the redbreasts float away south on the Air Line.

WILMOT TOWNSEND.

The Adirondack Black Bear.

By George Chahoon, in Report of the New York Forest, Fish and Game Commission.

It is probable that the black bear, *Ursus americanus*, is the only species ever found in the State of New York. They were once common throughout the State, but their habitat is now restricted to the Adirondacks and the Catskills. Grown bears of this species vary in weight from 150 to 400 pounds; but the young are surprisingly small. Merriam, in his "Mammals of the Adirondacks," says: "The diminutive size, premature appearance and helpless condition of the young of this species at birth cannot fail to excite surprise. They are not six inches in length, weigh less than a pound, and are not yet covered with hair. Their eyes do not open for more than a month. I know of no other mammal, except among the marsupials, whose young are so disproportionately small, or are born in such an undeveloped condition."

Although the white man kills the bear without any remorse of conscience, the Indians had such respect for his intellect and cunning that they endeavored to appease his departed spirit with various time honored ceremonies, in which an orator extolled his courage, regretted the necessity of his killing, and paid a tribute to the valor of the surviving members of his family.

In comparatively recent years there were a good many of the larger game animals in the Adirondack forests—of which the moose, the panther and the wolf have become practically extinct. Excepting the recent importations for restocking there is now no wild moose in the North Woods. It has been years since I have known a well-authenticated story of a wolf; and while it is possible the panther is not entirely extinct, if he still exists his numbers are few and his end near.

Practically speaking, of the larger mammals in our forest the red deer and the black bear alone remain. There seems to be a law, higher even than an act of the New York Legislature, that the wild beast must disappear before the advance of civilization; and while the development of the Adirondacks by the railroad, the summer hotel, and the pulp mill has added many to our school houses and churches, it has done much toward the destruction of our wild animals. Modern science tells us that all life is dependent upon its environment, and the repeating rifle loaded with smokeless powder does not make a favorable environment for large game.

Deer are quite plentiful, but in some respects the bear seems to have withstood the hand of man more successfully than the deer. Much has been done by our lawmakers to protect the deer, and the sentiment of man is against his destruction; but the bear has no man for his friend. No legislature has ever put any restriction upon his murder, while in some countries he is regarded as an outlaw and a reward is placed upon his head. Many thousands of dollars have been paid as bounties for his extermination; still he survives, and occasionally takes a sheep or a calf from some mountain farmer as a forced restitution for the wrongs inflicted on his race.

People who know the bear only in captivity do not understand him in his wild state. This sluggish, awkward animal will lead a dog in a wild chase over the highest peaks and most inaccessible places in our mountains, and when finally overtaken will turn upon his pursuers and, with one stroke of his powerful arm, send any dog within his reach howling away or lying bleeding and dying at his feet.

The wild bear is not only fleet of foot, but has great sagacity, is very alert and is seldom overcome in a fair field, even by our most experienced woodsmen. When taken in the summer or autumn he usually falls a victim to the large steel trap set cunningly by man for his undoing. Some close observer of human nature says "Cupid catches more with traps than he kills with arrows." I am not an expert on this subject; but to the bear I am sure the trap is more fatal than the rifle.

During the summer and fall they eat enormously and take on a great deal of fat; and when the cold weather comes they crawl into holes or caves, roll themselves up and lie dormant until the warm winds of spring carry away the snows. During this time a curious phenomenon takes place in the animal's digestive organs, which gives it the capacity of remaining through the entire winter in a state of lethargy without food while slowly consuming the surplus fat acquired in the autumn. As the stomach is no longer supplied with food it soon becomes quite empty, and, together with the intestines, is contracted into a very small space. No food can now pass through the system, for a mechanical obstruction, technically called the "tappen," blocks up the passage and remains in its position all winter. The "tappen" is composed of leaves and other woody substances. This habit of hibernation is a great protection, for if the bear roamed around all winter he would be easily tracked and overtaken in the deep snows; but once in his den, which is usually in some almost inaccessible mountain, it is nearly impossible to find him, and the drifting snows soon cover the entrance to his hiding place.

Like our National Weather Bureau, the bear some-

times makes a mistake about the storm; and occasionally snow falls before he retires for the winter, in which event he usually begins at once to hunt his hole. This is unfortunate for him; for whenever an early snow comes every bear hunter takes his rifle and tramps through the rough mountains looking for tracks, which if he finds he follows to the den where there is frequently a family of mother and cubs, which, in their semi-torpid condition, are easily killed.

The early snows and the large steel traps are the means of getting most of the bears killed in the Adirondacks. Occasionally a bear passing a runway where a man is watching for a deer gets killed. Sometimes a man comes upon one while still-hunting, and gets near enough for a successful shot; but instances of this kind are rare.

The bear is an omnivorous eater. I have seen his marks along streams where he had been looking for fish. He is known to rob bees' nests for honey; but in the summer and fall he lives largely upon berries and fruits of forest trees—acorns and beech nuts—and when wild cherries are ripe one frequently finds small trees and limbs he has broken down for the fruit. He has a great liking for ants, and in places where he is common, many of the half rotten stumps and old logs have been pulled apart by him while looking for ants and their eggs. This work can be easily determined, for his strong, sharp claws leave clearly marked scratches. They have a habit of biting and scratching the trunks of living trees for no reason I know; and it is not uncommon to find trees marked with the imprint of their teeth and claws.

Bears do not like to come into even as much of an opening as a mountain sheep range, and consequently they destroy but few domestic animals; but I have seen the remains of several sheep killed by them. It seems to be the general opinion of people who live in the Adirondacks that when a bear kills a sheep he eats all he can and returns in a night or two for another good meal on the remains. I have known of three instances where steel traps and strychnine have been cunningly prepared for his expected return, but he did not come back in either case.

The bear is hunted largely for sport. He is classed as "big game," and most hunters like to be the hero of a bear story. In addition to this his hide makes a fine rug, or it will fetch a good price from the fur dealer; his meat is eaten, but to my taste it is too fat to be coveted; and there is still another incentive for killing in the counties where bounties are paid.

The bear is far more sagacious and alert than the deer, and if he had the same protection he would rapidly increase. His destruction of domestic animals is trifling, and if his trapping were prohibited and the bounty on his killing removed, we might safely rely on the hunters' love of sport to prevent his becoming so numerous and bold as to be a cause of any real annoyance to our farmers. If instead of the bounty on his death the farmers were paid by the county for the sheep he destroyed, a more equitable arrangement would be made at a small percentage of cost to the taxpayer. This fall (1902) Essex county paid \$280 for the killing of 28 bears, and I very much doubt the killing of one sheep in this county by bears during the past year.

As illustrating the endurance and tenacity of life of the black bear, I will mention an incident in the experience of one of the most successful hunters ever in the Adirondacks. Some years ago Mr. George A. Stevens, of Lake Placid, found a bear track in an early snow, near his home, and taking his friend, Mr. Frank B. Stickney, after supplying themselves with their rifles and a knapsack of food, they followed the track over the rough mountains and through the thick swamps until dark overtook them, when they camped in the snow beside the track to renew the chase at daylight. During the following day Mr. Stevens had two shots, one breaking the lower jaw, the other passing through the animal's kidneys. The next or third day the snow melted so the track could be followed no longer, and after over forty miles of hard travel the chase was reluctantly abandoned. The following spring Mr. Charles Martin, of Saranac Lake, killed the bear swimming the lake, where Mr. Stevens went to see and identify it. The animal was reduced almost to skin and bones.

In the Southern States the black bear is hunted with dogs, who chase, bark at him, and bite his hind legs, and, being more spry of foot than he, manage to avoid the stroke of his paws. This torment is kept up until the bear in his desperation and desire to escape his tormentors climbs a tree, where the dogs bark and keep his attention until the hunter comes up and shoots him. I have never known bears successfully hunted with dogs in the Adirondacks, and I have never known them to climb trees to escape their pursuers, nor have I known dogs to follow them successfully; they either lead over some cliff where dogs cannot follow, or they successfully turn and drive them off.

The bear is a good swimmer, and does not hesitate to cross a lake several miles wide when it lies in his course.

It is probable that the habit of hibernating is undergoing a change among these animals in the Adirondacks. When I began to take an interest in this species, hunters used to tell me that the practice of "holing" during the winter was far from universal; that it was common to find bear tracks in the woods during the whole winter; and that they were frequently followed on snowshoes and killed. Merriam, in his "Mammals of the Adirondacks," says that bears frequently roam around all winter, or only retire for a short time when food fails, this being particularly true of the old males. It has been many years since I have seen a bear track after the cold weather really began; and hunters and men who spend a great deal of time in the woods tell me they never see bear tracks in the winter. My experience has been limited entirely to Clinton, Essex and part of Franklin counties, and it is possible the hibernating habit may differ as we get farther into the woods, where the bears have not been compelled to contend with man for so long a time, or as severely as has been the case in the territory covered by my observation.

Under the now accepted theory of "the survival of the fittest" we must expect changes tending to the

preservation of the animal; and while these changes are generally slow, they are sometimes quite rapid. Since I can remember, the partridge around Ausable Forks has largely changed his habit of alighting in a near-by tree when flushed; and it is certain that the chimney swallow did not build its nest in chimneys until the Europeans erected houses with these suitable nesting places. I know several instances where birds have changed their habits, and it would not be strange if so intelligent an animal as the bear found it safer to den than to be out during times of deep snows. Really, a change of habit requires no particular intelligence on the part of the animal. We have only to assume with Darwin "that there is a tendency on the part of the offspring to inherit the peculiarities of the parent." Under this theory the bears that stay out are killed, while the ones that hole are left to become the parents of the next generation. In this way a tendency that proves protective is soon developed into an instinct that becomes universal.

Bears are great travelers. During the autumn they roam over large tracts of country, and are frequently seen and sometimes killed when on these expeditions. The family to which the following incident refers were evidently on such a trip. On Sept. 9, 1899, Mrs. Chahoon and I went for a little drive, hoping to get a couple of partridges ere returning. We left our home in Ausable Forks in a single carriage, taking with us our little bird dog Bounce, and a 12-gauge shotgun. While going through a swamp near the Middle Kilns on the road to Saranac Lake, Mrs. Chahoon driving and I holding the gun cocked and ready for a quick shot at a bird, about thirty yards in front of us four bears came into the road, looked at us for an instant and then ran on ahead. Bounce, the dog, gave chase and was close to the bears as they turned to enter the woods on the opposite side of the road. This was fun for Bounce, and we sat laughing at his audacity, when soon we saw a procession of dog and bears coming toward us, the dog leading and the larger, older bear in close pursuit and clearly shortening the distance between them as they neared us. Don, our horse, not liking this style of a hunt, started to go home backward; but fortunately did not succeed in overturning us, only so placed the carriage as to give the dog and bears a narrow passage as they ran by. The dog had about six feet of lead, and as they passed I fired both barrels of No. 8 bird shot into the first bear at a range of about ten feet. She showed no evidence of having been hit, and kept on her chase for some twenty yards, when she turned into the woods, the other three bears taking to the woods when opposite our carriage. The dog quickly turned and followed them, and when about thirty yards from the road he stopped and began to bark furiously. I jumped from the carriage and started to go to the dog, and when nearly to him Mrs. Chahoon called excitedly for me to come to her. On getting back I found that another very large bear had come into the road and stood on his hind legs in front of the horse, while the horse rose on his hind legs and looked at him. As soon as our horse was quiet enough to be hitched, Mrs. Chahoon and I went to the dog, which was still barking at the bear, where it had fallen.

We tried to drag it to the road; but 200 pounds was more than our hands alone could manage. While thus engaged Mr. Edmund Roberts came along with the stage, and with his help the dead captive was put into his wagon and carried back to our home, where its hide now makes a fine rug on our floor. The ground where the bear was shot showed no blood or other evidence of the animal having been hit. Both charges struck near the shoulder and were driven downward; and part of them went entirely through the body. The shot was not bunched, but had separated so as to form a pattern resembling the top of a large pepper box. There was nothing to indicate a struggle, and doubtless she fell perfectly dead where she lay when we reached her. In all she must have run 50 or 60 yards with her heart riddled with shot.

It would be interesting if some fairly correct estimate could be made of the number of black bears now in the State. Realizing that any man's guess would be of little value, and with the knowledge that my data is far from exhaustive, I mention the following in the hope that it may prove something better than a mere guess.

The year 1894 was the last one in which the State paid bounties on bears, and that year we paid for the killing of 359 in the Adirondacks. With not very full data for a guide, and the record complete in only a few counties, I am of the opinion that the year 1894 may be taken as a fair average.

If bears have young every two years, and have two or three at a time, and half of them are females, with any reasonable allowance for deaths, other than by man, it would require a thousand mature individuals to sustain this annual loss of 359 without extermination; and I believe it is safe to assume there are more than 1,000 in the Adirondacks, as a large allowance should be made for loss and failure of young. The same rule would make the number in the Catskills about 500.

Michigan Ornithological Club Meetings.

THE Michigan Ornithological Club held the last meeting of the year at the Museum of Art, Detroit, December 4. The largest attendance of the year was present, and a very interesting programme was rendered. President Covert presided. The first paper was entitled "Notes on the Family Motacilla," by the veteran ornithologist, Jerome Trombley, of Petersburg, Mich. In the absence of the author, the paper was read by Mr. Blain, and a full account of the various species as observed in Monroe county was given. Mr. Norman A. Wood, of Ann Arbor, spoke at length on his recent finding of the first nests of the Kirtland's warbler in Oscoda county, Mich. Remarks followed by Messrs. Covert, Arnold, and J. Claire Wood. Prof. A. H. Griffith spoke on "Birds in Their Relation to Art," which subject was covered in an extremely interesting manner. From the very earliest period birds have occupied an important position in art subjects, especially among the Norsemen, Chinese, and Japanese. "The nesting of the Sandhill Crane in Michi-

gan," by Edwin Arnold, was the next paper. Mr. J. Claire Wood contributed an interesting sketch entitled, "Late Nesters." He has found occupied nests in every month of the year except November and December. President Covert gave a few remarks on his recent trip to the east, and an account of the John Lewis Childs Museum. A general discussion on the white-winged scoter, solitary sandpiper, and bufflehead followed by Messrs. Arnold, Swales, Covert, and J. C. Wood. A business meeting followed. Mr. Blain presented a corrected constitution, which was adopted. The club is divided into three classes of members, Honorary, Patrons, and Actives, the former being restricted to five. A number of new active members were elected. The membership of the club is now over one hundred, and will begin the year with bright prospects. The Michigan Ornithological Club was reorganized last February with A. B. Covert, of Ann Arbor, president; Bradshaw H. Swales, of Detroit, secretary and treasurer; Alex W. Blain, Jr., editor of the club organ, the Bulletin. The secretary is desirous of enrolling as members all interested in birds in any manner in the Great Lake region, and trusts that many of the sportsmen will send in their names.

BRADSHAW H. SWALES.

DETROIT, Mich., Dec. 10.

Another Labrador Duck.

SINCE the publication of the article on the Labrador duck in *FOREST AND STREAM* of December 5, our attention has been called to a note published by Mr. Witmer Stone, in Vol. X. of the Auk, which recorded the discovery of an adult male of the Labrador duck in the private museum of the late Geo. W. Carpenter, of Philadelphia, which in 1893 was presented to the Academy of Natural Sciences in that city. This specimen makes the representation of the species at the Academy, four instead of three individuals.

Game Bag and Gun.

All communications intended for *FOREST AND STREAM* should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

The New York League.

MANY matters of interest to devotees of the rod and gun were considered at the annual meeting of the New York State Fish, Game and Forest League, held at the Yates Hotel in Syracuse, Thursday, December 10, and it was decided to recommend a number of quite important changes in the game laws. There was a large attendance of delegates from different parts of the State, and the discussions proved very interesting. The various clubs represented at the meeting and their delegates were as follows:

Spencer Sportsmen's Club of Lyons—W. S. Gavitt and Henry Killick.

Chemung County Forest, Fish and Game Protective Association of Elmira—Joseph H. Considine.

New York Association for the Protection of Fish and Game, New York City—Robert B. Lawrence and John D. O'Connor.

Anglers' Association of Onondaga, Syracuse—John H. Forey and D. R. Cobb.

Schenectady County Fish and Game Protective Association—Dr. A. T. Sitterly.

Black River Fish and Game Protective Association, Utica—H. A. Pride and W. E. Wolcott.

Albany County Fish and Game Club—John D. Which. Rap-Shaw Fishing Club, Buffalo—J. P. Rapalje, of Buffalo, and H. E. Robbins, of Syracuse.

Honest Fishermen's Club of Seneca Falls—Ernest G. Gould and W. D. Clark.

St. Lawrence River Anglers' Association—A. C. Cornwall, of Alexandria Bay, and R. P. Grant, of Clayton.

Niagara County Anglers' Association—H. K. Wicker and M. H. Hoover.

Fish and Game Protective Association of Mannsville—A. T. Williams.

Newark Fishing Club—W. S. Gavitt.

Geneva Fish and Game Protective Association—C. C. Gates, C. S. Burrell, Nelson C. Smith.

Rensselaer County Rod and Gun Club—J. R. McLaren.

Central New York Fish and Game Protective Association—C. H. Mowry and F. C. Eddy.

Black Lake Game Club of Gouverneur—Andrew Irwin.

There were also numerous individual members of the League in attendance.

The meeting was called to order shortly before 11 A. M. by President Robert B. Lawrence, who spoke briefly concerning the existing game laws and the work of the League during the past year. He felt that the League should be congratulated upon what it has accomplished, as the laws were never better than now and no absolutely bad measures appear upon the statute books.

The Rap-Shaw Fishing Club of Buffalo, Central New York Fish and Game Protective Association of Syracuse, and Hudson Rod and Gun Club of Hudson, were formally admitted to membership in the league. The secretary reported the names of sixteen new individual members.

W. S. Gavitt, chairman of the organization committee, reported that the League embraces 40 different organizations and 75 individual members.

Charles H. Mowry, chairman of the legislative and law committee, referred to the satisfactory work of the committee in getting support in the Legislature for measures recommended by the League, and praised the untiring efforts of F. C. Eddy in this work. This committee succeeded in having several excellent measures passed, and prevented a number of vicious bills from becoming laws. There is but little new legislation to be recommended now, the main efforts of the organization being needed to see that no bad measures are carried through the Legislature.

Major J. W. Pond, Chief Game Protector of the State, was elected to represent the League at the convention to be held in Detroit, December 23, when efforts are to be made to impress upon the Canadian officials and upon the legislatures of border States the benefits to be derived from uniform laws for the Great Lakes. J. D. Which was chosen alternate.

Major Pond expressed his views regarding the licensing of nets and of boats engaged in the business of fishing along the Hudson. He stated that thousands of dollars might be derived by the State by charging a higher fee, which is at present only a nominal one, being one dollar.

Major J. W. Pond, A. C. Cornwall, and E. A. Bowman were appointed a committee on nominations, after which a recess was taken for dinner. At 1:30 P. M. business was resumed.

The League, after duly considering the various propositions submitted, decided to recommend that the following changes be made in the game laws:

1. That all non-residents of this State shall be required to pay \$10 for a license permitting them to hunt game birds, wildfowl, and all manner of small game within its boundaries, and \$25 for a license permitting them to hunt deer; also that residents be required to pay \$5 for a license permitting them to hunt deer in this State.

2. That the use of the automatic shotgun in hunting game birds and wildfowl be prohibited.

3. That the last 15 days of the open season for shooting deer be cut off, thus making the close season begin at midnight October 31, instead of at midnight November 15, as at present.

4. That a reasonable bounty be paid for the killing of foxes, large owls and large hawks. (Referred to the law committee with power.)

5. That no muskallonge shall be taken of less than 20 inches in length, and that if taken the same shall be returned to the water without injury.

6. That the closed season for shooting mud hens and gallinule shall be made the same as that for wildfowl.

7. That the sale of game birds and trout be prohibited until five days after the beginning of the open season, and of game birds five days after the beginning of the closed season.

8. That special game protectors regularly employed on a salary by incorporated clubs or associations, or by boards of supervisors, shall have the same power of search as the regular State protectors.

9. That Section 141 of the present laws shall be so amended as to apply only to fish, which will do away with the present right of bonded cold storage warehouse keepers and others to keep in their possession game birds or flesh in the close season for the killing of such birds or flesh, even though such may have been killed without the State of New York.

Considerable discussion arose over some of the proposed amendments, and there were many interesting arguments before final action was taken. In two or three instances the vote on the propositions was very close.

When the question of a gun license was being considered, Major Pond opposed the proposition on the ground that it might tend to keep away many sportsmen who now spend much money in the hunting regions. That it would lessen the number of hunters and therefore the number of deer killed each year is undoubted.

It will be advised by the League that the Maine system be employed in licensing hunters almost entirely. A provision of this will require that two coupons be issued with each hunting license, and that one of these be attached to every deer shipped out of the woods. Each being numbered, it is argued that no hunter could then bring out more than his allotted two deer in a season, the section of the present law covering this point having been violated, it is said, many times in the past.

The first draft of the committee's offering concerning automatic guns referred also to "pump" shotguns, but this was eliminated after discussion.

An effort was made to have the League favor opening the deer shooting season two weeks later than at present, instead of closing it fifteen days earlier, but the proposition was passed as recommended by the law committee.

There was a debate as to whether hawks and owls actually destroyed game birds, and there being a division on the matter, it was finally referred to the law committee, with power to act upon investigation.

R. P. Grant, of Clayton, was sponsor for the request that small muskallonge be protected. He gave an interesting talk upon the propagation of this species of game fish, and exhibited some pictures of muskallonge caught within the preceding two weeks weighing 41½ pounds each. They were taken from the waters of the St. Lawrence River.

It was said that by making the closed season for mudhens and gallinule the same as for wildfowl the prevention of all illegal marsh shooting could be accomplished, a point which is much desired. It was claimed that many hunters now shoot young fowl while nominally in quest of the other birds.

In recommending the proposition to prohibit the sale of trout and game birds until five days after the beginning of the open season, Chairman Mowry stated that it had been his experience to find trout and birds offered for sale on the morning of the opening day of the season, which must have been killed out of season.

The provision relating to special game protectors was offered and accepted nearly in the same form a year ago. Its passage would make the duties of a regularly employed protector much easier, and make him more feared by violators of the law.

John D. O'Connor and Major Pond opposed each other on the action against cold storage houses, particularly of New York city. These, at present, upon giving bond, are enabled to keep game birds and fish in storage even during the closed season for shooting or taking such in this State. Mr. O'Connor said he would introduce a bill into the Legislature to have this repealed anyway, but that he would like to have the League's indorsement. Although his associate, President Lawrence, took the floor against him, Mr. O'Connor, backed by Mr. Mowry, carried the day.

The following officers were elected for the ensuing year: President, H. K. Wicker, of Lockport; Vice-President, W. S. Gavitt, of Lyons; Secretary, Ernest G.

Gould, of Seneca Falls; Treasurer, A. C. Cornwall, of Alexandria Bay.

Legislative and Law Committee—Chairman, Charles H. Mowry, of Syracuse; F. C. Eddy, Syracuse; W. S. Gavitt, Lyons; R. P. Grant, Clayton; Garritt S. Conger, Gouverneur.

Auditing Committee—Chairman, Aaron Mather, Bridge-water; J. R. McLaren, West Sand Lake; C. W. Hatch, Lockport.

Biological Committee—Chairman, James Annin, Jr., Caledonia; Andrew Irwin, Gouverneur; Henry Killick, Lyons.

Organization Committee—Chairman, R. B. Lawrence, New York; John H. Forey, Syracuse; W. E. Wolcott, Utica; E. A. Bowman, Medina; H. McCormick, Albany.

President Lawrence positively declined a re-election to that office.

The newly elected president, H. K. Wicker, in assuming his duties, made a brief address.

A vote of thanks was extended to the Legislative and Law Committee and to the officers, particularly Mr. Lawrence, who ended a long term of service as president at this meeting.

A vote of condolence was extended to W. H. Thompson, of Alexandria Bay, one of the League's oldest members, who was unable on account of sickness to be present at the meeting. Adjourned. W. E. WOLCOTT.

UTICA, Dec. 12.

Strife in the Great South Bay.

As the result of a merry war waged off and on for years between the baymen of certain localities along Great South Bay and the members of various gun clubs, over the question of gunning privileges, it is thought that a movement will soon be made petitioning the authorities of the township of Brookhaven to purchase all bay bottoms, islands and marshes now in the hands of private individuals. It is the contention of those favoring the movement that if such a plan were carried into operation, not only the baymen and hotel keepers, but the township itself, as well as the general public, would profit thereby.

As matters now stand, it is asserted that gunning privileges along the best shooting localities are leased to clubs composed of a few wealthy members, who invoke the strict enforcement of the law on all who may be poaching, so to speak, on their leased preserves. This bars, it is said, the general public from participating in the sport of gunning along wide strips of land and water to which they have long had the freedom granted by time and custom.

Should these favored localities be made public property, it is said that the township would get ample return for the money so expended by compelling every gunner to purchase a license for the privilege of shooting. In this way, instead of the shooting being confined to a favored few New York sportsmen, everyone procuring a license could indulge in the pastime.

In speaking of the matter with a representative of *FOREST AND STREAM*, an old-time and prominent resident of Bellport said:

"The whole trouble is due to the action taken by the members of the Bellport Gun Club, who some eight years ago leased from the William Smith estate the strip of beach about a mile long and extending about one-quarter of a mile back into the bay, and that taken by the dozen or so wealthy New Yorkers, who, last October leased the Egbert Smith property, generally known as St. George's Manor.

"This property adjoins that leased by the Bellport Gun Club, and is the best shooting locality along the shores of Great South Bay. It extends four miles along the beach and controls all rights and privileges over the bay bottom of Moriches Bay, and spreads out over several thousand acres of the mainland of Long Island. Over these ten or twelve thousand acres of land and water the general public was practically allowed to roam and shoot at will. Now, if anyone is caught bagging a bird or duck on this vast bit of property, he is liable to arrest, and the law is strictly enforced. The whole matter is thoroughly un-American and reminds one of the strict punishment meted out to poachers caught on ducal game preserves on the other side of the ocean.

"Now, what is the result? The baymen are angry, the hotel keepers are disgruntled and the general public who have always had the privilege of shooting over this bit of territory are disgusted. For instance, suppose a man who has planned to enjoy a few days or a week or two of shooting writes to one of the hotel men at Bellport asking if the sport is worth the trip. The hotel man is compelled to write back that while the sport is excellent, the shooting over the waters of the bay and of the beach and mainland is all in the hands of a few persons, and all others are forbidden by law to indulge in the pastime.

"On learning of this the sportsman, of course, stays away, the hotel man loses custom, and the baymen, who have been accustomed to make a living by accompanying visitors on their shooting expeditions and renting boats, guns and other paraphernalia to them, have had their vocation taken away. When Fred Lewis, a grandson of Moses Taylor, had the lease of this property some years ago, he never objected to the public shooting over it, except over a small portion, which he restricted to the use of himself and friends.

"However, I don't think that the few New Yorkers who have leased the Egbert Smith property are having such a lot of fun after all. Many of the baymen by way of retaliation, sail their boats over the waters of the bay at all hours of the day and night, and by their shouts and the banging of guns have scared most of the ducks away. This is done particularly when it is known that some of the club members are about to indulge in a morning's shoot, and it has been empty bags for them, as a rule.

"Matters could be easily adjusted if the town of Brookhaven would buy title to the bay bottom and the strip of beach along Narrow Bay, where the sport of duck shooting has always been of the best. Enough sportsmen would gladly pay \$10 for point shooting and

\$20 for battery shooting to make the purchase pay a profitable revenue.

"For five years the Bellport Gun Club leased the rights of the bottom of Bellport Bay, and there was constant friction between the baymen and the club members. An end was put to these troubles about three years ago, when the township of Brookhaven, which owns the vested right in the bay bottom, refused to renew the lease, and the existing troubles were practically ended.

"However, ill feeling was again generated when, as I understand it, the members of the Bellport Club succeeded in having a law passed authorizing point shooting for ducks from Oct. 1 to Jan. 1, while battery shooting was limited from Oct. 19 to Jan. 1. This simply means in effect that the club members who control the point shooting, may revel in the sport for nearly three weeks before anyone else is allowed the privilege of shooting. By the time the battery shooting season opens the club members have enjoyed the cream of the shooting and then the public, which is prohibited from landing on the beach, may step in with their battery shooting. As the latter sport is not permitted in Moriches Bay, the club men there have the whole shooting match, as it is called, to themselves. To many of us who have been accustomed all our lives to shoot over the beach between the bay and the ocean and also over the waters of the bay, the present state of affairs, to put it mildly, is most irritating.

"Those interested in the present movement against the club members are agreed that in all fairness point shooting and battery shooting should begin and end on the same days, and a new law to this effect will probably be framed and submitted to the law makers at Albany."

Col. Alfred Wagstaff, one of the prominent members of the Bellport Gun Club, when seen by a representative of *FOREST AND STREAM* yesterday, stated that while he had heard that there was some dissatisfaction caused by the shooting privileges secured by the club, he could not see any real reason for it. "We are lessees of the property," said he, "and I think as such are entitled to all the rights and privileges that go with it. I wish to say that there is no truth in the story that the club sent word to Washington complaining that one of the men attached to the life saving service had been seen by us to shoot a duck and eat it for his dinner. The story is utter nonsense. When we had control of the Bellport Bay bottom three years ago the shooting over the waters of the bay was far better than it is now, and the public was granted many privileges. At all events we have leased the property and intend to hold on to our rights."

Mr. E. F. Hutton, of the banking firm of H. L. Horton & Co., is one of the dozen men who have secured a lease of the St. George's Manor property, comprising about 12,000 acres. "We have leased the property for shooting purposes," said Mr. Hutton yesterday to the reporter, "and I can't see where anyone has a legitimate right to kick. We have paid our good money for the purpose of enjoying a few days' shooting during the season, and why shouldn't we set up restrictions against the public. It is simply this. When I feel inclined to go for a few days' shooting I want to be sure of finding something to shoot at and not be compelled to get up at two o'clock in the morning for nothing. So to this end myself and a few friends leased the property. As we have paid for the privilege, what right has anybody to complain? I know that there are a lot of kickers down around Bellport way, but if they feel so badly about the matter as they profess, why don't they get together and take the lease off our hands. I'm pretty sure they could have it did they really want it. There isn't a kicker down there who, if he owned the property, wouldn't be glad to lease it to a gun club. We want the rights and privileges that we paid for secured to us, and we intend to have it so. We've got the best private shooting preserve on Long Island and we intend to keep it so. There are lots of other places that the public may shoot over."

Maine Big Game.

BANGOR, Maine, Dec. 12.—*Editor Forest and Stream:* Only three days more before the stroke of the midnight clock shuts off all big-game hunting for another year, and deer are still being slaughtered. The reports in the dailies still appear under such headings as "Game Record Still Holds Up," but just as to what "holds up" means it is a trifle difficult to understand, since the total record for the season will be far behind that of 1902, possibly as much as a thousand less deer. The daily shipments to and through this city are small, seldom running over twenty-five or thirty head, and more frequently less than the smaller number. Then, too, nearly every deer is labeled with the name and address of a resident of the State, one recent list containing but one non-resident in all those shipped. This would be natural, especially when it is such difficult work to get by the wardens a couple of days after the end of a season, as most people prefer to get out early and avoid complications.

The law says that a man shall have a reasonable time in which to get his game out after the season closes, but few sportsmen who are delayed beyond the limit fixed by statute seem to agree with the wardens and commissioners as to "a reasonable time." Three moose out of seven shipped down over the line on the second day of the month were held up as suspicious, although the owners assured the wardens the moose were legally killed on the preceding Saturday. The position of the officials of game protection seems to be that a man must prove his innocence, rather than the State prove his guilt, a complete reversal of the usual position of the law. Last year two sportsmen came out from one resort to a shipping point on the railroad either the first or second day of close season, having been delayed by storms from reaching the railroad station at which they shipped, and their game was on the platform of the station the last night of open season. Yet when they attempted to ship it from the junction point, where they took another railroad, the express agent refused to receive it for shipment, and they left it in his charge pending instructions from Augusta. Meanwhile an over zealous warden came along, determined

from the "fresh" look of the venison (so plain in frozen meat) that it was killed the day before, seized and sold it. All attempts to secure satisfaction had, up to the last reports, failed, although there were golden promises of nice bucks to make good their loss, if any such should be confiscated this fall. Possibly by this time the aforementioned sportsman is among the very few non-residents permitted to eat Maine venison emphatically his own, for which he has had to pay no license. If no deer has been sent him, he may decide to demand full satisfaction, as the promises are said to be all that have prevented action hitherto.

Notices have been issued to the members of the Maine Sportsmen's Fish and Game Association of the annual meeting, which is to be held in this city on the evening of Tuesday, the fifth of January, at the Bangor House. The meeting will be preceded by a banquet, for the first time in many meetings of the association, in this city, and it is expected that there will be a big gathering of the lovers of rod and gun to listen to Mr. Carleton tell of the great work of the Fish and Game Commission, and review the results of the adoption of the license system. The programme includes an interchange of views on the questions of importance to be brought out during the evening, and if some of those who hold divergent views of things as they are decide to express their views there, something lively may be expected. The committee on programme may not, however, find time to give to an open debate on fish and game, but feel compelled to confine the remarks to those who have previously been invited to talk.

HERBERT W. ROWE.

Possession in Close Time.

From the New Orleans Times-Democrat.

MERE possession is not an offense within the meaning of the Louisiana game law.

This is the meaning of the opinion handed down by Judge J. G. Baker, of the Criminal District Court, in the case of the State vs. James E. Salles.

The decision goes somewhat into the authorities of other States, and is of peculiar interest to men who hunt in the State of Louisiana at this season of the year.

Judge Baker, of the Criminal Court, has rendered a very interesting decision in the case, which was on appeal before him from a decision rendered by Judge Thomas M. Gill, Jr., last May.

Mr. Salles is the proprietor of the Victoria Hotel in St. Charles street, and he was charged with having a wild dead deer in his possession during the prohibited season. The evidence showed that Mr. Salles had bought the deer in the lawful season and kept it in cold storage, and used it as he needed it.

The Audubon Society for the protection of game, etc., caused an affidavit to be made against Salles in the First Recorder's Court for violating section 1 of the city ordinance No. 1386, approved Sept. 10, 1902, which reads:

"Section 2. Be it further ordained; That it shall be unlawful for any person or persons to offer for sale, or have in his or their possession, any wild deer during the months of February and March of each year." Upon being arraigned upon this charge, Salles, through his attorney, Judge Louis P. Paquet, filed a demurrer to the complaint on the ground that he could not be punished, if he were guilty, under the ordinance, because it contained no penal clause. Thereupon Judge Hughes sustained the demurrer and discharged Salles. An affidavit was then made against Salles before Judge Gill for violating the State law, act 65 of 1902, for having the same in his possession. His attorney, Judge Paquet, filed another demurrer to the charge, contending that the State law fixed another time for the prohibited period to have in possession wild game, etc., than the city ordinance, and therefore his client could not be held. Judge Gill overruled the demurrer and tried the case, and found Salles guilty, and sentenced him to pay a fine of \$10, or in default ten days' imprisonment, whereupon an appeal was taken to the criminal court.

Last Monday Judge Baker heard the argument made by E. B. Block, attorney for the Audubon Society, representing the State, and Louis P. Paquet, attorney for defendant Salles, which was an elaborate one, both sides citing numerous decisions of the Supreme Courts of other States, and took the case under advisement until yesterday, when he rendered a written opinion sustaining the defense made by Salles' attorney, and reversed the judgment of Judge Gill and discharged Mr. Salles.

This was the first prosecution under the new game law, which makes the decision important. The Audubon Society, it is reported, will have the next Legislature to amend the law in certain respects.

"The appellant was found guilty of having in his possession on the 4th day of February, 1903, the carcass of one deer, contrary to the provisions of section 5 of act 65 of the Legislature of 1902, entitled 'An Act for the Protection of Game Animals and Birds in the State of Louisiana,' and fixing the fines and penalties for violation of this act.

"From the judgment and sentence of the court, condemning him to pay a fine of \$10, and in default of payment to imprisonment in the Parish Prison for ten days, he prosecutes this appeal, contending that he has not rendered himself liable to conviction on the facts of this case, as they appear in the evidence against him. The admitted facts as disclosed by the record are these:

"That the appellant is the proprietor of a hotel; that during the open season as hereinafter mentioned for killing deer, and while it was lawful to kill and dispose of the same, defendant purchased and placed a deer in cold storage (on the 21st of January, and during the open season), where it remained up to the time of the making of this affidavit, that is, the 4th day of February, 1903.

"Section 1 of the act makes it unlawful to kill or pursue any deer, or have the same in possession after it has been killed or caught, except as hereinafter provided.

"Section 3 provides that the season for shooting wild deer shall open on the 1st day of November, and close on the 1st day of April of each year.

"Section 5 provides that it shall be unlawful to sell, exchange or have in one's possession any of the game mentioned in section 1, within the period during which they are intended to be protected by the provisions of this act, and it also makes it unlawful for any person

or corporation, acting as a carrier, to transport at any time any enumerated game in section 1 of this act, which shall have been killed in this State, beyond the confines thereof, provided that this section shall not apply to the shipment of wild ducks beyond the limits of this State.

"Section 8 gives the police jury of the several parishes power to change the dates of the opening and closing of the season, during which game mentioned in section 1 of this act may be killed, provided the length of the closed season shall not be less than the act now provides.

"The City Council taking advantage of the permission herein above referred to have adopted ordinance 1386, in which the opening season for shooting deer has been changed in the parish of Orleans from the date in the act. It is immaterial under the facts disclosed in this case whether we adopt as the closed season the time mentioned in the act, or that in the ordinance, which is made to commence on the 1st day of September, and to end on the 1st day of February of each year.

"It is contended on behalf of appellant that as the deer was killed and placed in cold storage in the open season, the fact that it remained in cold storage after the close of the open season was not an offense under the statutes.

"Counsel representing the State contend that it did not matter when the deer was killed, that the having it in possession by the appellant within the prohibited time created an offense.

"The question presented for decision is by no means free from difficulty, and a contrasity of decisions exist. I have found it impossible to reconcile the decisions rendered on the subject of the protection of game. No general rule of statutory construction has been applied to the legislative enactment against the possession, or procurement of game, during the closed season, but lawfully killed, each case depending largely upon the phraseology of the statute under interpretation.

"It, therefore, becomes necessary to go back to the object of the statute to see if the just intention of the Legislature cannot be best ascertained.

"The undoubted object of our statute is to prevent the destruction of game by limiting the time when it may be taken or killed. The undoubted object of this act was to prevent the destruction of deer during the breeding season and to carry out this object the killing of game was limited to the time specified in the act. Had it intended to make the mere possession of deer lawfully killed an offense it would have said so in plain and unequivocal language. It is the possession of deer unlawfully killed that is an offense, and not the mere possession of it at a particular time.

"It is conceded that the deer in question was lawfully killed, and was the property of appellant, and the fact that it remained in his possession after the close of the open season did not render his possession unlawful. Of course, when deer is found in one's possession during the closed season the presumption is that it was unlawfully killed, and it devolves upon the defendant to rebut this presumption. But it was never intended to hold him amenable to the act when he establishes that his possession had been acquired during the open season. If we are to adopt a literal construction of the act as contended by counsel for the prosecution and hold that possession merely without regard to the time when the deer was killed, then any person who should place game in his refrigerator on the last day of the open season and serve it during the next day would be guilty of an offense under this statute. A statute of this kind should receive a reasonable, and not strained, construction, and it was not intended that when a party comes into possession of game at a time not unlawful that he must consume it all upon the same day.

"All of the decisions under prosecution for the possession of game during the closed season, but taken or killed during the open season, have turned upon a consideration of the language employed by each Legislature in regard to the subject. In a number of the cases to which my attention has been directed by counsel for the prosecution an examination of the statute makes it clear that it was the intention of the Legislature to make the possession of game irrespective of the time when or place where the same was killed or taken an offense. In the State vs. Rodman the statute provided that no person should kill or have in his possession for no purpose whatever any fawn at any time, nor elk, nor moose, etc., before Jan. 1, 1898, nor any deer between certain times, except when the same shall have been lawfully killed. They may be had in possession for five days after the time herein limited. In State vs. Racy, provided that no person should kill, expose for sale or have in his possession game between the 1st of January and the 20th of October, and the act further provides that persons selling game shall not be liable to the penalty up to the 1st day of March, provided they prove it was killed before the prohibited time, thus giving two months to dispose of the game killed at a lawful time, and making the inhibition after that time absolute. The case of the State ex parte Mayor is not in point, as the section of the code there made it unlawful to kill or have in possession deer at any time. In the case of *Magner vs. People*, after making it unlawful to sell or have in possession any of the game mentioned in section 1 of the act, provides in section 6 that it shall be unlawful to sell or have the same in possession after the expiration of five days next succeeding the first day of the period in which it shall be unlawful to kill such game. A mere reading of the statutes above referred to leaves no doubt that it was the intention of the Legislature in these cases to make the mere possession of game during the closed season an offense. Had such been the intention of our Legislature the use of similar language or of language clearly indicating that it was its intention in framing the act now under consideration, to make the naked possession of game unlawful would have been very simple. If I am in error in regard to this interpretation it is a matter easy for the Legislature to remedy.

"This deer, when placed by the defendant in cold storage, became his property, and unless for use his possession of it at the time specified was not a violation of the act. I know in some of the cases called to my attention by counsel for the State are opposed to the views herein expressed. But it appears to me that a correct and true construction of an act of this kind is laid down in *Spade vs. Bucknam*. Where the statutes under con-

sideration were quite similar to ours, and where in each case it was held that the mere possession of game during the closed season is not an offense when it was killed in the open season. Both of the above cases are quite recent, and they contain an exhaustive review of the decisions in this country and in England on the possession of game during the closed season.

"In the Massachusetts case of *Commonwealth vs. Hall*, which was a prosecution under a statute for the protection of game, and where defendant had appealed from a conviction of having quail in his possession during the prohibited time, Chief Justice Gray, who delivered the opinion of the court, in discussing the proper interpretation to be placed upon it, said: 'The question presented is whether in the absence of any explicit manifestation of the Legislature the words "any such birds" are to be construed in the larger sense as meaning any woodcock, partridge or quail whatever, or in a restrictive sense, as meaning any woodcock, partridge or quail taken or killed in this Commonwealth within the times above mentioned.'

"By the first alternative the mere possession in the first part of every year, of birds that had been lawfully taken or killed in another State, or even in this Commonwealth, and that at a time when it was lawful to kill them here, would be made a punishable offense, as if, for instance, woodcock killed in the autumn should be preserved in ice after the first of January for subsequent consumption. To adopt such a conclusion when not imperatively required by the language of the act would be inconsistent with the ordinary rules of construction of penal statute.

"I imagine it would be difficult to find a statute which makes, or undertakes to make, the possession alone of property which has a legitimate use in and of itself a crime. Ordinarily, when possession is made criminal it is made so because the possession is wrongfully obtained, or the property had in possession is intended for some wrongful purpose. As an example of this, laws for the punishment of the receiver of stolen goods or keepers of intoxicating liquors intended for unlawful sale may be cited.

"Believing as I do that the possession of deer during the prohibited season can only be unlawful when the killing or taking was unlawful, the judgment herein rendered must be set aside and the defendant discharged, and it is so ordered."

New Hampshire Trapping.

BOSTON, Dec. 12.—*Editor Forest and Stream:* When Commissioner Wentworth, of New Hampshire, undertakes anything he is very apt to "get there." If he does not, we all know it is not his fault. Among the Revised Game Laws of that State is one against trapping by any person "on land of which he is not the owner or legal occupant" without the consent of the owner—penalty \$10, or 60 days' imprisonment. This law has been in force since 1897, and while some trappers have occasionally secured a few mink, muskrat or skunks, it is only lately that fox hunters have started in on a wholesale scale with improved methods and are stirring up a hornets' nest by so doing.

The up-to-date fox trap is a wicked looking affair with heavy steel jaws from 6 to 10 inches long and about the same width when set. Most of these traps have double springs so stiff they can be forced down only by using a lever in setting. Some of them have teeth, but even those without them make sad havoc of the limb of the animal, the jaws coming together with such force as sometimes to break the bone of the leg, and the frantic efforts of the animal to escape always lacerate the flesh in a cruel way.

The favorite place for setting a trap for a fox is a warm spring. A place is cleared in it several days or weeks before and the trap is set under water, hidden by a piece of turf cut to fit within the jaws and so arranged that the jaws will easily close over it, while the fringe of grass on the turf hides the iron. The turf is even with the surface of the water and the bait is a little way out in the pool beyond it. In trying to reach the bait without unnecessarily wetting his feet, the fox steps on the turf and becomes a prisoner.

A scent also is used which is as attractive to a dog as it is to a fox. This is dropped upon the turf and many an unfortunate canine has been caught while sniffing about the turf-covered trap. Cattle and sheep and occasionally people have been injured by the traps. The old-time fox hunters, seeing their favorite sport endangered by the extermination of the foxes, were eager to restrain the trappers. When the revision of the laws was made, therefore, in 1901, there were powerful influences in favor of retaining the old law, but while it was substantially continued, the penalty which had been \$25 was changed to its present form. The agitation of the subject kept trapping within rather narrow limits for a while, but of late the trappers have grown bolder and more active. Many complaints have been made of illegal trapping, in consequence of which the commissioners have put their deputies to work against offenders. The arrest of a couple of these men in Deerfield a few weeks ago by Commissioner Wentworth and Deputy Cardwell came as a genuine surprise to trappers Dodge and Stevens, who were fined a little more than \$50 apiece. The officers found these poachers had 100 steel traps set, and on visiting them a number of dogs were found caught in them. A host of pelts told the story of previous killings. During the last ten days of November nine other culprits have been arrested and fined \$10 each. The commissioners have also fined John Chester, of Northwood, and Elmer Daley, of Windham, for shipping partridges out of the State.

The result in these cases is highly gratifying, not only to the officers, but to the sportsmen of the State.

In another important case the result was different; the commissioners running up against an unexpected decision, made by Judge Young, of Laconia, which, if it stands, is likely to handicap the commissioners in securing the enforcement of the deer law in "close" districts that border on "open" territory. The story, briefly told, is this: A deer was driven by a hound into Lake Winnepesaukee at Gilford in Belknap county, where deer killing is prohibited. Mr. Merrill, a farmer of Gilford, and a section hand pursued it as it swam toward Tufton borough in Carroll county, which is open territory in the deer season, October and November. The men killed the deer as it neared

the shore. Commissioners Wentworth and Clarke arrested Merrill, charging him with hunting deer in Belknap county, thinking that according to the definition of the word "hunting" as given in Webster's International Dictionary, they had a good case. Part of that definition is, "to chase; to pursue for the purpose of catching or killing." It must have been a poser for the commissioners when the judge ruled that the defendant was not hunting the deer when he followed it from the Gilford shore in Belknap county. They fear the decision will embolden hunters to take deer in a similar manner elsewhere. They say it is not impossible when there is snow to take a deer's track and pursue the animal from a close county to an open one, and there kill it.

HENRY H. KIMBALL.

Illicit Wisconsin Deer Shipments.

MILWAUKEE, Nov. 29.—*Editor Forest and Stream:* Please take notice of inclosed article. I also seized two deer last week from the train at Milwaukee which were shipped by a Wisconsin hunter from the northern part of this State to Indiana.

According to the Wisconsin law no deer can be shipped out of the State except by a hunter who has a non-resident license, for which he has to pay \$25. He can take two deer, but he must be on the same train.

VALENTINE RAETHL, State Deputy Game Warden.

From the Milwaukee Free Press.

MADISON, Wis., Nov. 26.—All the laws of Wisconsin relating to the hunting of deer and even the Lacey act of the Federal statutes were broken last week by a party of hunters from Illinois, the members of which were Mayor A. Bergman, of Freeport, Ill., and H. R. Nelson and J. D. Hinds, of Lena, Ill. As a result of this the party lost by confiscation the six deer that had been killed and about \$400 worth of guns and other things which go to make up fine hunting outfits.

By trying to ship the best portions of five deer out of the State in a trunk, the party violated that section of the Lacey act which prohibits the shipment of game in concealment. By attaching the coupon from a resident license to the carcasses of the deer concealed in the trunk, which was checked to Lena, Ill., the State law prohibiting the shipping of game out of the State on a resident license was violated, and in concealing the game in a trunk the statute providing that all game offered to the railroads for transportation shall be properly labeled was broken. In addition to this, J. D. Hinds, of Lena, Ill., laid himself open to prosecution for hunting without a license, by attempting to use the resident license made out and issued to T. J. Hinds, of Monroe, Wis. Incidentally, T. J. Hinds is to be prosecuted for transferring his license to the Mr. Hinds from Illinois.

Mayor Bergman and his party appeared before Gov. La Follette yesterday to explain the situation and to extricate themselves if possible. They told the Governor that they had acted in ignorance of the law, and that the game warden had been unduly active and over-officious. The Governor listened to them patiently, and then personally conducted them to the office of the State Fish and Game Warden on the second floor of the capitol, where he introduced them and turned them over to Deputy Game Warden C. D. Nelson. They repeated the story to Mr. Nelson, who said that he would investigate, and that if he found the facts as they represented he would forward as many deer as they could produce non-resident licenses, and would release their guns. Mr. Nelson has investigated, and has found that the confiscation was warranted and proper. He will not release either the deer or the hunting outfits, and if the party will not return to Wisconsin to stand trial under the State law, he will turn them over to the Federal authorities for prosecution under the Lacey act governing the shipment between States.

The party had been hunting in the northern part of the State, and had secured six deer. When they started for home they took the train at Ingram, where they showed the carcass of one deer properly tagged and with the coupon of a non-resident license attached. They assured Game Warden J. W. Stone, who checked them up, that the one deer was all that they had. Stone, however, got on to the train and went through the baggage car, where he found a trunk addressed and checked to H. R. Nelson, Lena, Ill., and another addressed and checked to H. R. Nelson, Lena, Ill. The large Nelson trunk contained the best portions of five deer, and the other contained hunting outfits worth about \$300. When the train stopped at Cameron, he held both trunks and notified the department.

The deer in the trunk was tagged, and there was attached to one a coupon from the non-resident license of H. R. Nelson and to the others coupons from a resident license. Deputy Fish and Game Warden Nelson set out to run the whole thing down, and he soon found that the resident license had been issued in the name of T. J. Hinds, of Monroe. He went to Monroe and secured from T. J. Hinds an affidavit that he had transferred his resident license to a party composed of H. R. Nelson, J. D. Hinds, and A. Bergman, Mayor of Freeport.

The trunks of deer and hunting outfits are held at Madison. The venison will be shipped to the State Hospital for the Insane, and the \$300 worth of guns and other things that go to make up a hunting outfit will be sold here at auction—that is, unless Mayor Bergman and his party return to claim them. If they return they will be arrested and prosecuted under the State law. If they do not return they will be turned over to the Federal authorities.

This Bears on the Partridge Supply Question.

SAGINAW, Mich., Dec. 3.—*Editor Forest and Stream:* The following is a clipping from the Mt. Clemens Leader of December 1: "Mr. and Mrs. Wm. Sunderlin, the first partridge hunters to go north, are the last ones to come home. In their five weeks' hunting trip they bagged 650 partridges and quail. They were camped at Selkirk, Ogemaw county."

It seems as if comment was unnecessary, other than that this illustrates the necessity for a law that would be enforced, limiting the number that any one person can kill, to a reasonable amount. The Mt. Clemens Leader last year contained a similar account, and it seems that this man has been an annual butcher in the same manner for a number of years.

W. B. MERRISON.

Grouse and Woodcock.

Mr. A. B. F. Kinney's estimate of ruffed grouse scarcity in the vicinity of Worcester, Mass., having been disputed by other shooters, who have claimed that the birds were to be found in abundance, Mr. Kinney has made and published the following offer:

"It has been repeatedly stated by would-be partridge exterminators that they can start 25 partridges in one day's hunting within six miles of Worcester. Now, I make an offer, which is no bet, but made purely for information. I will give \$25 to any man who will start 25 partridges in a day's hunting within ten miles radius of my store, or city hall. This is extending the limit four miles, at which many hunters have claimed they could start that number of birds easily. The man who undertakes this offer is to take a man with him, and I will send another man. If, in the judgment of these men, 25 different partridges have been started, I will gladly give \$25 for the information. It is a widely known fact that my days of bird shooting have long since passed, and that my only interest in the partridge is in view of the pleasure and benefit to health which the bird affords sportsmen and hunters in pursuing it. I should like to have the partridge remain with us for this object only.

"A. B. F. KINNEY."

JAMESTOWN, N. Y., Nov. 28.—*Editor Forest and Stream:* Noticing your editorial in this week's FOREST AND STREAM asking sportsmen from different localities to report how plentiful they found ruffed grouse this season, I will tell what I know regarding this locality. It is the verdict of nearly all the sportsmen whom I have talked with in this section that birds have been far more plentiful this year than they were last. Last year I was out a number of times during the season and killed quite a few grouse, but it was rarely that I killed a young bird; while this year over one-half my birds have been young ones. Considering the good hatching season we had last spring, it does not seem as though there were as many young birds as there ought to be. Still, there are a great many more than last season. Snow now lies on the ground over a foot deep, and has been for the last ten days, making the walking so hard that scarcely any of the boys have been out at all lately, thereby saving a great many birds for next year's breeders, and there are a great many left over in this locality, and as season closes Monday in this State, very few more will be killed.

Birds have laid very well to dogs almost all this season until this snow came, when they have been as wild as hawks since.

I have never since I could remember seen as many woodcock killed in this locality as this year, I having killed as many during this fall as I have killed before in all the years I have carried a gun. They were all flight birds, as none breed here. Taking it all together, we have had quite a fair sprinkling of woodcock. I hope this gamy little bird is on the increase.

If we have a good nesting season next spring, we will have some grand ruffed grouse shooting here next fall. It ought to be better than for ten years. May we all sincerely hope so.

C. H. Y.

WELLAND, Ont., Can., Dec. 12.—Ruffed grouse on the high grounds are to be found in fair average numbers, but on the low marsh grounds scarce. The hatch was good, but immediately after the cold wet rains set in, and the young were almost entirely destroyed.

On my holidays this season I was about forty miles in the bush south of the Canadian Pacific Railway (main line), starting at Wahuapital, which is between North Bay and Sudbury. I found large game—deer, moose, bears, lynx and wolves—plentiful, but the feathered friend (ruffed grouse) very scarce. Where last season I found plenty of birds, this season very few, about a ratio of one to ten. Only about five per cent. of the birds I shot were young. The game wardens and fire rangers told me the young were destroyed by the hundreds owing to bad weather.

G. C. B.

SPRINGFIELD, Mass., Nov. 27.—You ask a difficult question when you wish to know why the ruffed grouse is scarce in the covers of New England, as well as in other parts of the country. But question or no question, the fact remains that the so-called partridge of New England is rapidly disappearing, and especially in the southern part. The season, which will have closed before this will be read by the lovers of New England's greatest game bird, has been unusually disappointing to the hunters of Springfield and the surrounding cities and towns. In years past we have had our finest sport with the ruffed grouse, and many have been killed, but many have been left in the covers for seed, and the sportsmen did not seem to realize that the birds were in danger of extermination. When the Massachusetts hunting season was shortened a few years ago it was felt by most men interested in the preservation of game that a step had been taken in the right direction, and that fewer birds, especially young birds which had not attained their full strength and growth, would be killed. But this did not seem to be the case with the partridge, at least. Each year they have grown wilder and fewer in number, and this year the man who has killed a good bag of ruffed grouse in the covers near this city is as hard to find as the grouse themselves. Andrew Hill, of East Longmeadows, who is one of the finest shots in New England, and who hunts a great deal, has not killed a single ruffed grouse this year, a statement which he has never been able to make since he was tall enough to ram powder into a muzzleloader. His case is an exception, of course, but it is a straw which shows the general direction of the wind.

The reason for the rapid disappearance of the grouse in this section can largely be laid to the exceptionally wet weather which followed after the hatching season. When the trout were beginning to take an active interest in life, people along the brooks saw partridges and saw little chicks as well. One man reports seeing two large broods very near together; in fact, he nearly stepped on the chicks in the last one he saw, and the old hen flew up into his face and showed signs of fight until the youngsters had scurried away among the leaves and vanished. Then she played the old broken

wing game just as the first bird had done. In a number of places signs of the chicks were found, and their little tracks showed clearly in the white sand, which they had toddled through, but when October came only an old bird or so could be found in the woods where the little chicks had started life. No dead chicks were seen or could this be expected, but where there were youngsters in the spring there were few grown birds in the fall, and this tells a part of the story. It is not fair to assume that foxes and skunks caught most of them, although they probably accounted for a few, but foxes are not common enough in this section to do a great amount of damage.

Another cause for the passing of the grouse is the great increase in the number of hunters in the woods. During the past few years many more men have taken to hunting than enjoyed their leisure in this way in the old days. They kill a number of birds each year, even while they are learning to find themselves in the field, and whenever they flush a bird they are apt to shoot and scare it so that the next man will find it wild and discover that it will not lie for the dog, but will flush wild. A large number of partridges have been snared by the "boy on the farm" in this section in the past, and this lessens the number of grouse to a large extent. The sale of the ruffed grouse is now forbidden in this State, but while every effort has been made to have the law enforced, there are some men who sell birds still. Market hunting in this section has largely died out, however, so this offsets the number of hunters killing birds for their own use to a large extent. There is plenty of food for the birds in the fields and woods, so that this can have no effect on the lessening number of the birds. In the Berkshire Hills, where there have always been many birds, the hunters report that their bags have fallen off fully 50 per cent. this year, and they lay the blame to the bad weather early in the season and to the increasing number of hunters.

Another reason which makes me firmly believe that the bad weather in the spring killed many chicks near this city, is the scarcity of quail. Last fall, when the season closed, there were large numbers of quail left in the fields, and during the winter the farmers continually reported seeing the birds. The winter was not a hard one, and when spring came everyone began to prophesy a great quail year. But when the season opened the quail did not seem to be around, and during the past week they have been just as scarce. The birds mated and hatched out their chicks in the spring, for many little families were seen, but the rain must have killed them, and it must have killed the young grouse as well, for both are delicate and both easily take cold and die.

The story of the ruffed grouse in Maine seems to be more happy, and while the number may have decreased, no one seems to have noticed it greatly. The season opened there on Sept. 15, and while there may not have been good sport there since that time, there certainly were grouse enough to go around during the first week of the season in the Rangeley region. Even though I did not make it a point to hunt the birds there, I killed a number which were flushed from the trails in going through the woods, and the birds seemed very tame and flew slowly in comparison with the grouse of southern New England. They acted more like the blue grouse of the Big Horn Mountains, and were about as easy to kill. In Maine, of course, the hunter is supposed to shoot the bird's head off with his rifle, but as the grouse sits in the road or in a tree and waits for the slaughter, it is an easy thing for the expert. But in time they will get scarce in the big woods, just as they have done with us, and legislation is the only thing which will prevent extermination. It saved our quail a few years ago, it should be tried with the ruffed grouse and the woodcock now.

CLICK.

Massachusetts Deer.

SANDWICH, Mass., Dec. 13.—*Editor Forest and Stream:* The rowing down of a deer in the waters of Mashpee Lake, the fierce struggle for mastery, the final capture and imprisonment of the deer in an ice-house, constitute the principal features of an adventure credited to Harry Conant, of Mashpee by a news item in the Boston Globe of December 8.

I do not think the writer of that item fully realized to what an extent he was exposing the illegal hunting of deer in this section, but I am very glad that it got into print, from the fact that it greatly strengthens the statements of Central and myself in FOREST AND STREAM of November 28 to the effect that deer are being hunted and hounded in this section in direct defiance of the law.

Everyone who knows the habits of the deer, knows that they are not swimming a mile or more in the icy waters of Mashpee Lake at this season unless driven to it by dogs, and from the above it will be seen that they are not safe even when they have thrown the dogs off the track by taking to the water.

Now, as to the legal aspect of this case. If the statements made in the Globe item are true, did not young Conant, deliberately and with malice aforethought, hunt, chase, capture, and imprison this deer in direct violation of Chap. 245, Acts of Mass. Legislature of 1903?

There is no claim made in the item that he did this to rescue the deer from the dogs; no claim that the deer was exhausted and unable to take care of itself. Now, has not Conant left himself liable to the penalty imposed by the law?

JAMES M. MCARDLE.

A Deer in Cambridge.

BOSTON, Dec. 12.—*Editor Forest and Stream:* On Thursday last, between 7 and 8 o'clock A. M., a large doe was seen in the streets of the University City, much to the surprise of hundreds of people. After coursing through several streets, dodging teams and electric cars, the deer found the entrance to the house numbered 456 Massachusetts avenue, pushed in the door and bounded up the stairs, entering a chamber where a Mr. White was in bed. When this gentleman recovered from his surprise, he pushed the animal out into the hall, but it returned to the room, and he managed to force it into the closet and close the door. Among those who had been following the deer was Mr. Wm. H. Watts, of Brighton, who, with

the assistance of several others, threw her down and carried her to the furniture moving store of Mr. R. N. Burns, and placed her in a box-stall in Mr. Burns' stable, where she remained until yesterday, when Deputy "Tom" Burney took her to Wyoming and set her free in the vicinity of the Middlesex Fells. When Mr. Burns was told that under the law he was liable to a fine of \$100, he was considerably disturbed, and sought the commissioners at the State House, and they decided that his action was in no way malicious, but rather a charity, and worthy of commendation. Probably no other wild deer ever came so near gaining admission to Harvard or Radcliffe.

A letter addressed to President Reed from Mr. Oliver Gay, Crystal Lake Farm, Haverhill, reports that a deer has been feeding with his young cattle for a couple of months, and when recently, on account of snow, the cattle were driven into the barn, the deer followed them, and has been housed with them for some days. Having been told that he was violating the law, Mr. Gay wrote for information as to the proper course to be pursued. I learn to-day that Deputy Burney has been sent to liberate the deer.

These occurrences might not seem strange in Maine or northern New Hampshire, but in this locality they excite a great deal of interest. Only a few days ago a deer was reported meandering the streets of Newburyport.

Without question the increased number of deer in our State is very remarkable. It is very important that they go unmolested and every person who loves to see the beautiful creatures should feel a degree of responsibility for their preservation, so long as it is illegal to kill them. As a curiosity, the inclosed letter is hard to beat.

(This is an exact copy of a letter received this week. Perhaps you would like to print it, leaving out the name of the sender.)

"HAMPDEN, Mass., Dec. 8, 1903.—Dear Sir Mr. James Russell Reed on the twentie first of november in the year of 1903 i was walking to the store and i though i heard something coming a long behind me and just as i turned a round to see what it was i was nock down bey a Big deer he Jumped over me and one of his leages strook on the back and lamed me up so i had to have a Dr. Ballard attended me i had two hard weeks of sicknes and i aint over it yet and i dont think i ever will thaire was a good maney persones saw the deer and they sed that he wasnt verry fraid it cost me a good deal of expenses I expect to here from you some i shant stel for nothing less thin one \$1000 dollars for what i have ben through hoping to here from you in a weak yours trulie

CENTRAL.

Our Christmas Number.

THERE seems to be a gratifying unanimity of sentiment among readers and advertisers as to the Christmas number of FOREST AND STREAM. This is pleasant to editor and publisher alike, for their highest ambition is that readers and advertisers should receive from the publication of FOREST AND STREAM as much pleasure and profit as possible.

The text and illustrations in the body of that issue may speak for themselves, and about them we need say little, but a word may fitly be spoken concerning the many and beautiful advertisements which appeared in it, and which for attractiveness of illustration and interest of matter were almost, if not quite, as attractive as those pages devoted more exclusively to the entertainment and edification of the readers. Among the advertisements appearing in large space in the Christmas number of FOREST AND STREAM are found those of many firms which have been in business almost since modern sportsmanship began. Such firms have seen a variety of ups and downs in the history of sport in this country, and in the trade in guns, ammunition, fishing tackle and yachts, and have witnessed the rise and fall of many so-called sportsman's journals. Many of these firms have been printing advertisements in the FOREST AND STREAM from the very first days of their establishment in the trade, and there are a few whose advertisements have appeared in the FOREST AND STREAM in every issue that has appeared from its beginning, away back more than thirty years ago.

Such long business association comes after a time to mean more to advertiser and publisher than a mere matter of dollars and cents. These firms have long been our friends, as we are theirs, and we have come to regard it as quite as important that they should prosper as it is that we should prosper.

The Christmas FOREST AND STREAM made its appearance well in advance of Christmas Day in order that the information which it contained might be as useful as possible to readers and advertisers alike.

The FOREST AND STREAM has no stronger wish than that the Christmas season may be happy for both.

CHICAGO, Ill., Dec. 4.—*Editor Forest and Stream:* I have been spending the evening with your very attractive issue of FOREST AND STREAM of Dec. 5, and particularly interesting is the article on the Labrador duck.

RUTHVEN DEANE.

BEAVER BROOK FARM, Milford, Conn., Dec. 3.—*Editor Forest and Stream:* Your Christmas number of FOREST AND STREAM is superb, and I congratulate you on it.

M. G.

NEW YORK, Dec. 3.—*Editor Forest and Stream:* Permit me to congratulate you upon the beauty of the Christmas number of FOREST AND STREAM. It is the best number, I think, that has ever come off your presses.

WM. DUTCHER.

NEW YORK, Dec. 5.—*Editor Forest and Stream:* Permit me to congratulate you on the great success of the holiday edition of FOREST AND STREAM, which I had an opportunity to examine carefully at my home last evening.

It is perhaps pardonable in an advertising man to be more

interested in the advertising pages than in the regular text; but I think that so handsome, effective and numerous are the business announcements in this number, that they will run a close race with the text in the attention of even the lay readers.

My congratulations and compliments on this.

WM. H. JOHNS (of George Batten & Co.).

BATAVIA, N. Y., Dec. 5.—*Editor Forest and Stream:* Your Christmas number has reached us, and I must compliment you upon it as being the finest edition of any sportsman's paper I have ever seen.

F. M. FARWELL,

Sec. and Treas. Baker Gun & Forging Co.

CHICOPEE FALLS, Mass., Dec. 5.—*Editor Forest and Stream:* We wish to express our hearty congratulations on the appearance and general effectiveness of your Christmas number. This special number of your publication reflects great credit on your enterprise, and is a beautiful piece of work.

Our full page advertisement makes a most striking and handsome appearance, and we trust that this publicity may prove a profitable investment. Kindly send us six more of your Christmas number.

J. STEVENS ARMS & TOOL CO.

WORCESTER, Mass., Dec. 5.—*Editor Forest and Stream:* Will you kindly give space to an old reader (one who has followed the publication from infancy to manhood), who wishes to express his heartfelt satisfaction over your present Christmas number. It is a jewel.

I did not recognize it on my favorite news stand, and inquired if they had not received the Christmas FOREST AND STREAM. The reply was the presentation of the current number. It is beautiful; and I warm to it as I would to a first offspring, if that could even be vouchsafed to me. It is redolent with all that is good and true in clean sportsmanship.

J. W. B.

SAYRE, Pa., Dec. 5.—*Editor Forest and Stream:* Abler pens than mine, in more felicitous phrase, will write in expressing their appreciation of the rarely beautiful Christmas number of FOREST AND STREAM, sent upon its world-wide travels last week; but as an humble contributor to the dear old paper for the past dozen years, I desire to thank you for this wonderfully handsome and altogether delightful Christmas issue. Considered from every point of view, it is a work of art, and nothing quite so fine and fascinating has previously been published by a journal devoted to the interests of sportsmanship. It is a unique example of literary attainments, photographic skill, artistic finesse, typographical perfection, and vivid illustration of a multitude of things ever dear to the sportsman's heart. Long live FOREST AND STREAM! And merry Christmas, in good truth, to its editors!

M. CHILL.

Sea and River Fishing.

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Decrease in the Size of Game Fishes.

BY EDWARD A. SAMUELS.

"WHEN I was a boy, things were quite different," said an old gentleman to me as we were comparing notes one day. "Yes, the winters were much more severe, the cold being much more intense. Why, bless your soul, I have seen the trunks of big oaks and chestnuts split open their whole length by the frost; the snowfall was vastly greater than it is now. Yes, we always had from two to four feet of snow all winter and it filled the roads even with the fence tops; breaking out the roads in those days was no boys' play, I can tell you, and as for fish and game, I could always get all the partridges (ruffed grouse) I wanted in two or three hours, and ducks and shore birds were almost too plentiful. I've seen the time when I could bag 500 or 600 golden and black breast plover in a day on Nantucket. Ah, those good old days are gone, never to return."

Of course, I assented to all he said, and added, jokingly, "Yes, and the average size of game fish has decreased, too."

After we had parted, my thoughts turned to fish and fishing, and the idea that the size of certain fish had decreased grew on me to such an extent that I sat down and made a lot of mental notes, which convinced me that my jesting remark to my friend was far from being a joke, and I believe that my brother anglers will in a greater or less degree coincide with me in my opinion. Now, I have handled the rod almost fifty years (not so many years as my old friend had, for he is a hale and hearty octogenarian, and can yet cast as good a fly, and can cut down his bird a-wing as well as the next comer), and I have killed my share of most varieties of our game fish, and ought to be able to judge fairly well in relation to this matter, but if I am in error I shall be glad to be set right.

First of all, there is no doubt in my mind that the Atlantic salmon averages considerably smaller in size than it did thirty years ago, and this conviction comes upon me from an experience on most of the Canadian streams. The Port Medway, in Nova Scotia, used to furnish, thirty or more years ago, most excellent fishing, and salmon of 12 to 15 pounds' weight were far from uncommon, and an 18-pounder was not rare. I have not fished that river for a number of years, but I noticed that the size of the fish had lessened when I was last there, and am informed that a 10-pound fish is now seldom killed, and 6 to 8-pound fish are the rule, and not over-abundant at that.

Of course, this decrease is attributable in a measure to overfishing, but I believe that the Micmac Indians have done more than their share in reducing the salmon in size and numbers along the coast to the northward. The Gold, East, Ingram and Indian rivers, which, thirty years ago were good salmon streams, giving the angler 10, 12 and occasionally 15 or 18-pound fish, are now almost depleted, 6 to 8-pound fish being

looked upon almost as prizes. There is but little poaching done on these streams, and the decrease in the size of the fish has probably been caused by overfishing, all these rivers being very accessible from Halifax.

In Cape Breton there are several salmon rivers, the chief one being the Margaree. I wish that that magnificent stream could be restored to its old-time glory. Every angler who has cast the fly upon its waters will agree with me that it is an ideal salmon river, and such beauties as we used to take! I venture to say that the average weight was considerably over 10 pounds, and a 20 and even 30-pounder was far from rare. Now a 10-pound fish is the exception, and even 8-pounders are not very common. In fact, it is a wonder that the fish is not extirpated, for the river is heavily netted at its mouth, and is poached most unmercifully. The natives net and spear the fish as fast as they come into the pools, and, if by chance, a salmon escapes one season, he is in wonderful luck, but he never lives many years, and this notwithstanding there are several wardens stationed on the river and one resides near one of the best upper pools where spearing is much in vogue.

In this pool some very large fish have been taken, one weighing 38 pounds was pursued by the natives and was finally killed by a spear that was specially made to encompass his broad back.* I have conversed with a number of the natives, and find that they care nothing for the laws; all they want is to "corn down" a barrel or two of the delicious fish for winter use.

In New Brunswick waters the average size of the fish has decreased very perceptibly. The salmon in the Nepisiquit now rarely exceed 10 pounds in weight, while formerly they often reached 18 to 20 pounds. I do not think that the river is overfished, but that it is poached I have no doubt, and the shore netting at its mouth is heavy.

I have not fished the Miramichi River or its tributaries for a number of years, but I am told that the magnificent great fish, 20-pounders and over, are now rarely taken, and the number of fish grow smaller every year.

This may easily be attributed to poachers and heavy netting. I venture to assert that every pool from salt water up to the Big and Little Swogle rivers is poached almost every night in the season. I have seen the poachers at work from my tent at night, but was powerless to prevent them, and to one who is used to the signs of the woods, the rolls of partially consumed birch bark, which had been used as torches that are to be seen on every pool, tell a melancholy story.

I have often wondered how a salmon ever got by them, but a few do every year. The gill netting at the shore off Newcastle and Chatham, is very heavy, as many as 400 or 500 fish going into the freezer as a day's catch.

There are several smaller streams emptying into the Baie des Chaleurs, between the Miramichi and the Jacquet River, but I think they are not visited by salmon.

The Jacquet is not a large river, none of its pools being wider than can be covered by a long cast, but it is a fairly good salmon stream, and it abounds in large and gamy sea trout. It has upward of twenty pools, which salmon visit, and it is an easy and satisfactory river to fish. I was for five years one of three lessees who controlled it, and my memory teems with recollections of the many pleasant outings I have enjoyed on it, with fly-rod, canoe and camera.

I never killed a large salmon in any of its pools, but they were gamy in the highest degree. I had fished the river before my term as one of the lessees began, and I had a good opportunity to observe the diminution in the size of the fish; from 8 to 10-pounders they gradually dropped down to 4 or 5, and they became scarce at that.

This was not owing to overfishing with the rod, and probably but little poaching was ever done on it, but to the erection of a freezer near its mouth, with its attendant gill nets, which lined the shore on both sides, the decrease is wholly due. When the freezer was in active operation it often received as high as 150 fish in a day, the average being about 50.

One may easily see what the effect of such a drain on the numbers of the fish would have on the river. Connected with the freezer and operated by the same parties, was a lobster cannery, which, in its palmy days, employed 30 hands as "crackers and packers." I watched the work done in this establishment with a good deal of interest, for I felt that it was in a fair way to exhaust the supply, for an immense number of traps were set, and every lobster, large and small, was boiled, and some of them were very small, indeed.

The operations of this cannery furnished a good object lesson, showing that the crops of the sea may be exhausted as well as those of the land, for so clean a sweep of the crustaceans was made, the cannery was obliged to suspend operations in the fourth year of its existence, there were not enough lobsters obtainable to make it profitable to run the works.

Apropos of lobsters, an interesting experience which I once had comes back to my memory. I used to, in the good old times, take an occasional outing on the Indian River, which empties into Margaret's Bay, about 25 miles west of Halifax, N. S. In those days in the early sixties, it was a good salmon stream, the fish being of good size and the pools being all easily get-at-able.

When my day's sport was ended I passed a few hours on the verandah of the hotel, which was run by the Masons, who were well and favorably known to many of the angling fraternity, and often took horse and wagon for a drive down the delightful shore road along the bay. On one occasion we passed a lobster fisherman, who had just come ashore with his catch. It is to be remembered that lobsters in those days were larger than they now are.

I stopped the horse and inspected his catch, and accepted as a present a couple of the handsomest specimens.

I thought that our menu at the hotel would be varied satisfactorily by the addition of lobsters occasionally.

and bargained with the lobster catcher to bring to the house 25 cents' worth twice a week. The next day, in the afternoon, as I was enjoying my after-dinner cigar on the veranda, I saw the man coming up the road with a horse and small open wagon; he stopped and backed the wagon up to the hotel steps and uncovered his load. "What have you there?" I asked.

"These are your first lot of lobsters, sir," he replied.

I gazed on the great green and black monsters for a moment in much astonishment, and then asked him if he meant that the lobsters were all mine.

"Yes," he replied, "and more, sir, if you want."

There were two or three bushels, and all for a quarter of a dollar. I told him that a half dozen would suffice, and he picked out a few that would make one stare nowadays; huge fellows they were, with great claws five or six inches in width and nine or ten inches in length; it is needless to say that we reveled in lobsters during the remainder of our stay there. I give this incident to show that lobsters as well as game fish have decreased in size and numbers. A quarter of a dollar would not pay for much of a lobster catch just now, even at Margaret's Bay.

But to our muttons.

Passing up the Bay Chaleur, there is no salmon river of any consequence until we reach the grand old Restigouche, which, with the Metapedia and Upsalquitch rivers, constitute, in my opinion, the most magnificent series of salmon waters in the world. I know of none to compare with them. And what noble fish used to accept the feathered lure in former days! 18 and 20-pounders were common, and 30-pound fish were by no means rare.

It is true those monsters were not as gamy as a 15-pound fish usually is, but their strength and fighting endurance were something wonderful.

Now, I have had no opportunity to examine the records of the Metapedia Club, but I will wager a big apple they will show that the average weight of the salmon taken in the club's waters has steadily diminished, and that a 15-pound fish is as large as is usually taken.

It takes a long time to build up a 30-pound salmon, and at the rate the fish are netted all along the bay at the mouth of the river, there will be a slim chance for any more fish of that size to be grown.

I had an opportunity to inspect a large tank containing a great number of salmon that the fishery officers were keeping in the river near Flatlands, in 1886, until the spawn would be ripe enough to take, and was astonished to find that they were almost wholly 10 or 12-pound fish, and they were regarded as very satisfactory big fish by the officials.

I asked if they got no 20 or 30-pound fish, such as were common in days of yore, and they replied that such large fish were now (1886) rarely seen.

Restigouche salmon have been noted the world over for their great size and strength, but "how are the mighty fallen!"

Along the northern or Quebec shore of Bay Chaleur and away out to Gaspé Bay (into which empty a number of good streams) are several notable salmon rivers, the most important of them being the Grand Casca-pedia, one of the best salmon streams in America, if not in the world. It is a Government river, the fishing on it being mostly reserved, but occasionally an American has a chance to cast a fly on its waters, and wonderful have been the catches they have made. Several of my friends have been among the favored ones, and the accounts they gave of the sport they had was most exhilarating, to say the least.

I have before me a photograph taken about twenty years ago, of a catch of thirty-five salmon by four rods in three days, on this noble stream, which averaged a weight of 29½ pounds.

This wonderful record is one to be remembered, though it had previously been equaled, I understand, but at the present time the average weight of the fish killed there is very much less than the above.

Emptying into the St. Lawrence River, along its northern shore, are a number of splendid salmon streams, many of them being as familiar as household words to the readers of FOREST AND STREAM, but the big fish that once ascended those rivers are now no more, 10 to 15-pound salmon being considered heavy weight fish.

Now, the decrease in the size of the salmon has been constant in all the rivers I have named, it has extended throughout all the most important waters in the Dominion. I do not believe that anyone who knows much of angling will attribute it to overfishing with the fly, for no matter how industriously the angler may strive, he does very little to diminish the number of the fish, he cannot, for the reason, that not one salmon in ten will come to his lure, but it is the gill nets on the bay shores and the seines and spears of the poachers that have done the work.

The salmon, in going to their home rivers, move along the shore of the bays and other bodies of salt water into which those rivers empty, and the owners of gill and other nets improve every opportunity to spread their engines of destruction. One who has not witnessed the extent to which this netting is carried can have no conception of its magnitude.

Of course, the demands of an ever-widening and exacting market seem to the netters to be sufficient excuse for their destructive work. "After us the Deluge," has been the motto in the New World, and whether it has been in the extirpation of the bison or the wild pigeon, the salmon and other game fishes, or the destruction of the noble forests, it has constantly been the shibboleth, the watchword for the reckless and improvident.

In "With Fly Rod and Camera," nearly twenty years ago, I urged the necessity for government action in putting a greater limit on the work of the netters than has been enforced, and once more I make a plea that more strenuous efforts shall be made to further limit the net catch. If this is not done I can confidently predict that the next generation of anglers will have to be satisfied with fish smaller even than the present reduced average weight.

Now, curiously enough, although the weight of the Atlantic salmon is less than it was thirty years ago, the weight of the so-called landlocked salmon, which are not exposed to the perils of gill nets, seines and weirs, has increased very much. In the early sixties I used to visit the Grand or Schoodic lakes in Maine on the New Brunswick border, above Calais, in pursuit of the white trout, as the landlocks were then called, and their average weight in those days was hardly a pound and a half. I suppose in the years I fished Grand Lake stream I took several hundred landlocks, and I do not remember of ever getting a 2-pound fish, and my experience was not different from that of others. Thaddeus Norris, in his "American Angler's" book, gives an account of catches made by certain parties as follows:

In June, 1856, three rods, six days, 634, trout, 872 pounds.

In June, 1857, three rods, six days, 432 fish, 642 pounds.

In June, 1858, two rods, eight days, 510 fish, 725 pounds.

The average weight of these, therefore, was about the same or a trifle less, than that of the fish I killed a few years later. But, although anglers have been abundant, the fish, owing to wise protection, together with a better supply of food, have steadily increased in size and weight, as will be seen by the following statement by Mr. W. T. Buck, printed in "With Fly Rod and Camera."

Comparison of records shows a gradual increase in size of the Schoodic salmon handled at the spawning season, and a marked increase in the yield of eggs per fish, thus: Two hundred and thirty-five males weighed and measured in 1877, averaged 16.8 inches and weighed 1.8 pounds; and 247 weighed and measured in 1886, averaged 20.3 inches and 3.46 pounds; and 348 females weighed and measured in 1877, averaged 16.1 inches and 1.9 pounds; and 505 females weighed and measured in 1886, averaged 20.1 inches and 3.58 pounds. I visited the hatchery on Grand Lake stream in November, 1886, and saw the landlocks taken from the "corrals" or yards, and manipulated for their eggs and milt, and was simply astonished to see the little 1½-pound white trout that I used to catch transformed to 3½-pound salmon. Nowadays a landlock of 3½ pounds is not regarded with wonder, fish weighing 10, 12 and even 14 pounds being taken in the Maine lakes.

Another species, not, however, usually regarded as a game fish, but one that is the most gamy that swim, the bluefish, has also fallen off very considerably in size within the last twenty years; trollers could, in former days, count on an average weight of 10 or 12 pounds. I have seen the time when I could stand on the beach near Sciasconsett, on Nantucket, and casting the artificial squid, or the eel-covered leaded hook far out into the surf, and hauling it in, hand over hand, bring in my 15-pounder at almost every cast, and so strong were those fish, it seemed sometimes as if it were a question as to whether I would land them or they would pull me into the ocean. Nowadays 5 and 6-pounders are very satisfactory fish.

Aside from their value as an exceptionally gamy fish to the angler, who uses a stout rod, heavy salmon or bass reel, 100 yards of line and a piece of fine piano wire for a leader and hook baited with a strip of menhaden, squid or small fish, the decrease of the bluefish in size and numbers is not an unqualified misfortune, for they are terribly destructive of other valuable food fishes in the testimony given by different fishermen and printed in the report on the sea fisheries of the south coast of New England for 1871 and 1872 by Professor Spencer F. Baird. It was stated that a single bluefish will destroy upward of 1,000 other fish, such as menhaden, mackerel, scup (or porgies) in a day; one fisherman said that he had taken from the stomach of a 3½-pound bluefish upward of 50 young scup (porgies), and others stated that these savage destroyers will gorge themselves with mackerel, scup, etc., and then eject the contents of their stomachs and begin again. It is a great wanderer, having been taken in almost every quarter of the globe, and its visits in great numbers in any given locality are not always to be counted on.

It is unquestionably to the angler a valuable species, for it puts up a savage and persistent fight, and is, withal, if cooked when freshly killed, a valuable table fish; but in consequence of its savage nature and predaceous habits, its diminution of size is not so great a calamity as is that of the other species I have named.

Another of the angler's favorites—that magnificent game fish of the sea, the striped bass—has also deteriorated in size and weight, 20, 25 and 30-pounders of bygone days now being conspicuous by their absence; in fact, some of the localities in which they were formerly abundant are now entirely abandoned by them. Professor George Brown Goode, in his Report on the Fisheries of the United States, mentions bass weighing 50 pounds as often occurring in the Potomac, and states that one weighing 112 pounds is the record fish, but such fish as those were monsters; indeed, now, I have no doubt that the records of the Cuttyhunk, West Island and other bass fishing clubs will show that there has been a gradual but decided falling off in the weight of the fish that have been taken in recent years. In Professor Baird's report, above referred to, frequent mention is made of 20 and 25-pound fish, and the hand-line fishermen often spoke of filling their boats with a day's catch that was in Buzzard's Bay; in Vineyard Sound equally large fish were also taken, but a bass weighing over fifteen pounds in those localities is now a rarity.

Further east, as for instance, Nahant, Thatcher's Island and in other points near Cape Ann and in the Merrimack River, very large fish used to be killed. I have seen striped bass ranging as high as 30 pounds taken at Thatcher's Island; this is thirty years ago, but now the most industrious and persistent angler can only occasionally take an 8 or 10-pound fish.

I once saw a specimen that was exhibited in Quincy market, Boston, which weighed 45 pounds, and 30-pound fish frequently found their way into that market.

On one occasion I saw some very heavy bass killed by the explosion of dynamite in the Weymouth River

*"With Fly Rod and Camera," page 41.

below the bridge at Quincy Point, Mass. The dynamite was used by workmen, who were blasting the rocks in the channel to deepen the water, so that large vessels could ascend the river to the wharves at the bridge; some of the bass weighed between 20 and 30 pounds, and there were several that even exceeded the latter weight; the presence of such large fish in the river was a surprise to the residents of the neighborhood, who never dreamed of such monsters being in their waters. It would be equally as great a surprise nowadays for them to take a bass there of any size whatever, for I believe that they have abandoned the river entirely.

Now this destruction of the bass cannot be laid at the doors of the angler or the hand-line fishermen, but it is unquestionably due to the weirs and pounds which gather in every fish, large and small, which enter their fatal portals.

In the Report of the Massachusetts Commissioners for 1901, the catch of striped bass in the pounds, weirs, etc., is stated to have been 25,451 pounds; with such wholesale slaughter as that one may readily see that this valuable game fish will in the near future become so rare as to be hardly worth the angler's efforts.

In winters ten or fifteen years ago, I used to receive a box of bass that was sent me by a friend at New-castle, N. B. They were taken through the ice in the Miramichi River by spears or by dip nets thrust down to the mud at the bottom, when the fish were more or less torpid.

My friend sent them to me as a treat, and I always unpacked the boxes with a great deal of pleasure, but the bass were very small, averaging not more than a foot in length, and I have often thought that our own fish, judging by the way they are now deteriorating in size, will soon be no heavier than those sent me by my friend.

Sawdust and Fish Life.

Editor Forest and Stream:

Referring to the injurious effects of sawdust on fish life, will you kindly allow me to offer the following notes on the subject from the fishculturist's point of view:

One of the first difficulties which the early trout breeders in this country had to overcome, was the presence of a fungoid growth that always appeared in the wooden troughs or boxes that the eggs were hatched in. It invariably grew on, and from the surface of, the wood that the troughs were made of, and in all our personal experience in hatching fish eggs, we never knew a single instance, east of the Mississippi, in which fungus did not appear on the surface of the wooden hatching troughs very soon after the water was turned into the troughs, unless the wood was very old or had long been water soaked. In these cases, the fungus does not appear to so great an extent, but when the lumber is new, the fungus, except in highly oxygenated waters, invariably appears very soon after the water comes in contact with the green wood.

This fungus is one of the most deadly things in the world to trout and salmon eggs. It is so destructive that if a million trout eggs were put into green lumber troughs to hatch, they would every one of them be killed before they hatched. Not one would escape. "Domesticated Trout," speaking of this fungus (page 126, sixth edition), says "Fungus is a vegetable growth of a low order, which makes its appearance almost invariably where there is water, and especially on newly cut wood, on which it eventually becomes a mass of nearly colorless or milky slime."

"This fungus, if once present in the hatching water, will certainly attach itself to the eggs, and when it does, their fate is sealed; you cannot save them from its effect, for it never lets go its hold. It will surely eat out the vitality of the embryo within, and will either kill it entirely or will leave a puny, lifeless, transparent creature, which will in all probability never live to grow up. It cannot, therefore, be guarded against with too much care."

In consequence of this action on the surface of lumber under water, wooden hatching troughs were formerly charred, and now are all covered with a coating of asphaltum on which fungus does not grow. No fish-culturist of any experience would now think for a moment of using wood for hatching trout or salmon eggs, without first covering every part of the surface under water, with asphaltum or something furnishing similar protection against fungus.

Now, if the exposed surface of the three planks which form the hatching trough can exercise such a deadly and universal effect on the fish eggs that are in it, what a vast power of injury there must be in sawdust, in which form the exposed surfaces of the wood are multiplied almost indefinitely. Take an inch board a foot square and reduce it all to sawdust, and it will give an amount of exposed surface almost infinitely greater than the board itself. Then consider what must be the effect of throwing tons of this sawdust every year directly upon the spawning beds of the fish, and where the sawdust will float down to the spawning beds below, if there should happen to be any below. From the moment the sawdust falls into the water it begins to produce the fatal fungus, and makes it absolutely impossible for a fish egg to hatch where it is, and what is more, the invisible fungus which destroys the eggs so effectually, gets into the gills of the young fish that are exposed to it and kills them also; and, besides this, by one of those wonderful instincts that are implanted in the lower animals, fish will avoid a stream where the conditions of spawning are unfavorable, and sooner or later will abandon a stream, the spawning beds of which are covered with sawdust.

The writer trusts that the above considerations are sufficient to show that large deposits of sawdust should be looked upon with much suspicion in streams that are valued on account of the fish life that is contained in them.

Lake Champlain Pollution.

ANNOYED by the continued delay of the report of Prof. Landreth, Consulting Engineer of the State Board of Health, in regard to the pollution of the waters of Lake Champlain by the pulp mill in that region, D. C. Clark, of the well-known Wall Street firm of Clark, Dodge & Co., stated yesterday that he intended to employ expert chemists who would make an immediate and thorough investigation.

Mr. Clark's extensive estate is located on Lake Champlain, about two miles south of the mouth of the Boquet River, on which the mills of the New York and Pennsylvania Company are situated.

Said Mr. Clark: "The State authorities have lagged so much in the matter that I have decided to begin an investigation and have a chemical analysis of the waters made at my own expense. In so vital a matter delays are dangerous. With the report of my chemists in hand, more active steps will be taken to abate the evil."

"The agitation of the question of the pollution of the waters of the streams flowing into Lake Champlain and the waters of the lake itself, has aroused interest of the most far-reaching character, involving, as it does, the question of sewage, as well as other matter capable of polluting waters in which the public, in general is concerned."

"People have been accustomed to treat bodies of water along which they have land as if they owned the water as well as the shore, but this is not a fact, as is well known to all students of riparian rights. As a matter of fact, no individual corporation has a right to use any stream or body of water as a dumping ground for refuse of any character that will make the same unfit for drinking purposes or for the habitation of fish, be the same sawdust, chemicals or sewage."

Mr. Edward Hatch, Jr., of Lord & Taylor, who returned to town yesterday from a week's stay along the shores of Lake Champlain, states that the waters of the lake and of the rivers emptying into it are lower now than they have been in years. The portion of the banks exposed by the receding waters, he says, is covered with a nasty, ill-smelling slime which everyone declares is caused by the refuse from the pulp mills. Fears are entertained that an epidemic of typhoid fever may result, and residents along the borders of the lake are in despair over the slow action of the State authorities. The feeling, it was said, seems to be general that the mill owners who have for so many years successfully defied the law, will, on account of certain political affiliations, continue to do so.

Those interested in fighting the pulp mill owners at Lake Champlain are somewhat jubilant over the fact that the manager of the American Strawboard Company at Tiffin, Ohio, has just been fined \$500 and sentenced to ten days in jail for contempt of court, the charge having been the pollution of the Sandusky River by emptying paper mill refuse into it. It is hoped that the New York courts will soon take similar action against the owners of the offending pulp mills.

Scores of leading property holders along the Vermont side of the lake have already signed the petition which will soon be laid before Gov. McCullough, which appeal, it is hoped, will impel him to take more active and material steps to abate the evil. The owners of the pulp mills on the Au Sable River continue to deny that they are evading the law. Those interested in fighting the mills point to the Twentieth Annual Report of the State Board of Health, wherein the said board of health describes the Au Sable River as polluted by refuse and discharges from said mills.

"The situation is growing more acute every day," said Mr. Hatch, yesterday, "and I believe in a comparatively short time we will have forced the mill owners, through the courts, to end their acts of pollution. Public opinion is arrayed against them, and the bluffs they have worked for years will no longer avail."

American Fishes.

MANY readers of FOREST AND STREAM have read with great interest and profit the late G. Brown Goode's book, "American Fishes," published in 1888, a volume "prepared for the use of the angler, the lover of nature and the general reader." The work has been highly successful from every point of view, and having been out of print for some time, Dana Estes & Company, the present owners of the copyright and plates, have published a revised edition to meet the continued demands for the book. Not only has the work been revised, but it has been largely extended by Dr. Theodore Gill. The additions are a most excellent portrait and biographical sketch of the author, an editorial preface of two pages, an introduction of forty pages, and at the end of the volume, new chapters on the whitefishes, the smelts and their allies, the eels, and the sturgeons.

The principal addition to the book given us by Mr. Goode is Dr. Gill's so-called Editorial Introduction, in which he treats of the geographical distribution of fresh and salt water fishes, their popular names, scientific nomenclature, and gives a systematic index of species. The chapter on the popular names of the fishes is especially interesting, and shows much study and a wide acquaintance with the literature upon the subject. The systematic index of species shows at a glance the fresh water fishes of the Mississippi Valley and Atlantic slope, the fresh water fishes of the Pacific slope, salt water fishes of the Atlantic coast, of Florida and the Gulf of Mexico, and of the Pacific coast. Both scientific and common names are used, making the index especially useful to the generality of readers and students.

Colored plates of several of the species are given, but owing to the poor manner in which they have been reproduced, are not noteworthy. That of the common sunfish is simply execrable, and the proof could not have received the approval of the editor.

Altogether, this already valued treatise upon one of the most fascinating branches of natural history has been made still more useful, and will doubtless receive a hearty reception from the ever-increasing throng of readers of the literature on American fishes.

B. A. BEAN.

WASHINGTON, D. C.

Maskinonge.

Editor Forest and Stream:

Surely the plea advanced last week by Mr. Chambers for general acceptance of the name maskinongé should appeal very strongly to all who are interested in our northern fishes. It would, indeed, seem undesirable as well as hopeless to choose for adoption one of the corrupted forms mentioned—mascallonge, muskallunge, and what not—and with the annoyance to both writers and readers caused by the present diversity of spelling, the change proposed should be most willingly accepted. To the considerations so well presented by Mr. Chambers it may be added that the prevailing corruptions referred to are such as to quite offend an Indian-trained ear.

Regarding the meaning of the name, the opinions given in favor of "deformed pike" are from high sources, and might fairly be taken as conclusive. When to such authority is joined the important support of Father Lacombe's dictionary of the Western Cree, there seems in fact no room left for discussion. Yet strangely enough another view is held by scholars of uncommon opportunities. There are at least two authors in the Algonkian, missionaries among the tribes, who assign to maskinongé the meaning great, or greater, pike; and some inquiry among the Indians themselves by the writer has failed to weaken their position. "Means big pike," was the dictum of a Montagnais, born to the language. The actual fact of the matter could be determined without much trouble almost anywhere along the northern border, and as the name is perhaps as interesting in form and subject as any we have inherited from the primitive tongue, its correct meaning is not likely to continue long in doubt. It is not too much to say here that the word as hitherto explained quite fails of the usual aptness of Indian descriptive names. Even if *mask-* may be translated as "different," in agreement with Bishop Lafleche, it is essentially a word of stigma, and by our standards inappropriate to an obviously splendid fish. The final decision in the matter must rest, of course, upon the authority of the wigwam, and is, fortunately, not far to seek. If Mr. Chambers especially, among those favorably situated, would pursue the subject further upon opportunity, the facts of the case should soon appear.

W. B. CABOT.

Boston, Mass.

Ring in Shark's Stomach.

LARS PETERSEN, an able seaman of the steamship Hypatia, which arrived recently from St. Lucia, is looking for a woman who in some way lost a ring with the initials "L. H. B." engraved on the inside, and which was in some way lost at sea. Petersen has the ring.

After the vessel left St. Lucia a large gray shark was seen following it. For two days he continued in the wake of the ship, when Petersen resolved to hook him. Procuring a large hook, he baited it with salt pork, and after some difficulty landed the monster, which measured almost 12 feet from tip to tip.

Thinking of the stories of treasures found in sharks' stomachs, Petersen procured a knife, cut the animal up, and found the ring.—New York Times.

The Kennel.

Russian Wolfhound Club of America.

NEW YORK, Dec. 11.—At a meeting of the executive committee of the Russian Wolfhound Club of America, held December 7, it was voted to award twenty special club prizes for competition at the coming Westminster Kennel Club Show. Four silver challenge and other cups offered from this and foreign countries, together with twelve other prizes to be awarded under the auspices of the club, were accepted.

A full classification (ten classes) for Wolfhounds has been secured, and steps are being taken to make this the record exhibit of the breed.

JOSEPH B. THOMAS, JR., Hon. Sec'y.

Cincinnati Bench Show.

A BENCH show will be held in Music Hall, Cincinnati, Ohio, January 12 to 16, in connection with the sixth annual show of the Cincinnati Poultry and Pet Stock Association. Dr. Geo. Clayton, of Chicago, will judge all breeds. The superintendent is Dr. Henry Loth, of Cincinnati. Strong efforts are being made to organize a kennel club in this city, and if this is done fanciers can look for an A. K. C. show next year.

BONASA.

Points and Flushes.

The Texas Field Trials Club's second annual field trial is fixed to take place on January 12, six miles from Floresville, Texas, on the ranch of Mr. J. S. Thornton. The stakes, All-Age, Derby, Members' and Champion Stakes will be run in the order mentioned. A special railroad fare has been arranged. For other information apply to the secretary, Mr. T. A. Ferlet, San Antonio, Texas.

From Bird to Buzzard.

LOUISVILLE, Ky., Dec. 2.—Miss Elizabeth Bird, of Harrison county, near Paris, started early in life to feather her nest well.

Her first venture outside of the home nest was when she married Bud Martin. When Mr. Martin died she married Edward Crow, a prosperous farmer. When the time came to change she allied herself with William Robbin and lived happily until the matrimonial season for Mrs. Robbin again rolled around. Then David Buzzard, a widower, appeared. Mrs. Robbin became Mrs. Buzzard to-day.

Into the Buzzard eyrie the bride carried one little Martin, two little Crows, and one little Robbin. One little Buzzard was already there to welcome them.—New York Times.

Yachting.

Designing Competition.

\$225 in Prizes.

Two designing competitions have been given in FOREST AND STREAM. The first was for a 25ft. water-line cruiser; the second was for a 15ft. one-design class. Both competitions were very successful. The great interest taken in those competitions has prompted us to give a third one, open to amateurs and professionals. The prizes which will be given are as follows:

First prize—\$100.

Second prize—\$60.

Third prize—\$40.

Fourth prize—\$25, offered by Mr. Theodore Zerega for the best interior plan.

The designs are for a yacht conforming to the following conditions:

I. Centerboard cruiser, 40ft. l. w. l.

II. Boat must not draw over 6ft with centerboard up.

III. The lowest freeboard to covering board must be 3ft.

The design must be modern in every particular, without containing any extreme or abnormal features. The conditions have been made as simple as possible, that competitors might have all latitude and scope in working out their ideas. We wish to produce an able and comfortable cruising boat, one that shall have ample accommodation for two or three men living aboard for a period of several months, and one that can be easily managed at all times by two or three paid hands. The draft is restricted to 6ft. in order that the boat may have access to nearly all the desirable harbors, and may, thereby, widely increase her cruising field.

Drawings Required.

I. Sheer plan, scale $\frac{3}{4}$ in.=1ft.—showing center of buoyancy, center of lateral resistance and center of effort of both rigs.

II. Half breadth, scale $\frac{3}{4}$ in.=1ft.

III. Body plan, scale $\frac{3}{4}$ in.=1ft.

IV. Cabin plan, inboard profile and at least one cross section, scale $\frac{3}{4}$ in.=1ft.

V. Two sail plans, scale $\frac{1}{4}$ in.=1ft.; one as a yawl; one as a pole mast sloop.

In the case of the yawl rig the position and height of the mast and length of gaff are to be the same as in the cutter rig. Plans must show working topsail and size of light sails.

VI. All ballast outside on keel except amount necessary for trimming.

An outline specification must accompany each design. The drawings should be carefully made and lettered. All drawings should be on white paper or tracing cloth in black ink. No colored inks or pigments should be used. The designs must bear a nom-de-plume only, and no indication must be given of the author. In a sealed envelope, however, the designer must inclose his own name and address, together with his nom-de-plume. All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, not later than March 1, 1904. All drawings will be returned, but postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all of the designs.

Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, who passed upon the designs submitted for the 25ft. with great care, has again consented to judge the designs and make the awards.

Gasolene Engines for Marine Propulsion.

Read at the eleventh general meeting of the Society of Naval Architects and Marine Engineers, held in New York, Nov. 19 and 20, 1903.

BY D. H. COX, MEMBER.

THIS paper is not intended in any sense to be a treatise on the gasolene engine from the designer's point of view, nor does its author claim to be an expert on the subject of which he is writing, merely desiring to present to the society as a matter of history certain interesting facts, and to draw certain conclusions therefrom regarding the advance of the gasolene engine. This aim is quite in keeping with the society's desire to have its proceedings form a record yearly of progress and development in matters with which it is concerned. To anyone desiring exact details and the minute information required by the designer of engines of this type, reference is suggested to some one of the many excellent treatises now in print on this subject.

The development of the automobile having demonstrated the possibilities of explosive gasolene engines for vehicle propulsion, their application to marine work has followed as a matter of course. While the many troubles and accidents that have been experienced by the majority of automobilists have tended to prejudice the minds of many persons against these engines, this should not really be the case. Rather should it be con-

Speed Launch Standard at about 21 Miles an Hour.—Plate 10.

sidered decidedly to the credit of an engine of its type that it has been able to be used with any degree of success for automobile work, the conditions of which make its operation a matter of the most careful design and manipulation. When the governing conditions for the automobile and marine motor are contrasted, it will be seen that in each instance the most serious obstacles in the way of the successful operation of the former are, if not absent, at least minimized in the latter. The heat produced in the cylinders from the high temperatures of the exploded gases can, in the marine motor, be readily drawn off by an unlimited supply of circulating water, while in the automobile the cooling effect of the air must be relied upon; the limiting conditions of weight and space for engine and fuel are not as a rule restrictive in a vessel as in a vehicle, thus permitting a greater fuel supply, and the use in design of much larger factors of safety with corresponding increase in freedom from breakdowns; the dust and grit, with their disastrous effects upon automobile engines, are not to be contended with; the conditions of use are more severe for the automobile, forced as it is to go up and down steep grades over rough road beds, with very variable loads and speeds.

After considering these facts, it does not appear at all remarkable that the manufacture of marine gasolene engines, having been given an impulse by the automobile, should have gone on increasing in magnitude at almost an unprecedented rate. A cursory glance

through the advertisements of any of the technical, or even untechnical, publications of the present day, will be sufficient to convince anyone that this industry is in a flourishing condition, even if the surprisingly large number of power boats of all classes now in existence were not conclusive evidence of this fact.

The application of this engine has been along many and widely different lines. Among the working vessels, they have been largely used by the oyster and fishing fleets along the coast as an adjunct to sail power, thus saving much time in getting to market and making the fisherman more independent of weather conditions. In almost all the fishing villages, also, where dories or surf boats are used to run out to the nets, many boatmen now have motors that save much time and labor. In the yachting world they have taken a firm foothold. There are gasolene house-boats, "steam yachts" with masts and dummy stacks, auxiliary schooners, yawls, sloops and catboats, besides the ever-increasing fleet of "power boats" proper, or launches of the various types, cabin or open, cruising or racing. To see for the first time a fully sparred schooner, for example, running along at a nine-mile gait, with no sail set and no visible means of propulsion, is decidedly novel. It may take away some of the romance of sailing to have a feathering blade up against the stern post, but think of the convenience when cruising and caught off shore at night in a calm with provisions short and a good harbor near at hand.

Speed Launch Adios at 23 Miles an Hour.—Plate 9.

Although, as stated, this is not to be a treatise, in any scientific sense of the word, on the gasoline engine, it does not seem out of place to describe, for the benefit of those who may not be thoroughly familiar with the subject, the general nature of the operation of these engines and their manner of installation.

The motive power is an explosive mixture of gasoline vapor and air in proper proportions, which is ignited at the proper time in the cylinder space generally by means of an electric spark. Benzene is midway between gasoline and kerosene in the distillation scale, and is commonly known in the oil trade as naphtha, the grade used for gasoline engines being usually about 72 degrees Beaume scale.

The engines are divided into two distinct types—the two-cycle and the four-cycle. In the former the piston receives an impulse once in every two strokes or each complete revolution, while in the latter the explosions occur every fourth stroke or every second revolution. In the two-cycle type the crank space is enclosed in an air-tight case, this space as well as the cylinder being connected to the air and fuel supply. On the up stroke the piston suction draws air into the crank space through a vaporizer, in which it is charged with gasoline vapor, the degree of saturation being regulated by a needle valve controlling the gasoline opening. This charge is compressed by the succeeding down stroke, and by means of a port uncovered just before the end of this stroke is allowed to rush up into the cylinder space, there to be again compressed to from 75 to 85 pounds by the piston during its next up stroke, and exploded just before the end of this stroke. Thus during each up stroke one charge is drawn into the crank case and another is compressed in the cylinder and ignited, while during the succeeding down stroke the ignited charge is expanding and doing work, and the new charge after being compressed in the crank case, is transferred to the cylinder preparatory to compression and ignition, the burnt gases having escaped through an exhaust valve just before this. In the four-cycle type the crank space is not enclosed in an air-tight case, and the operations of drawing the charge, compression, ignition, expansion and expulsion have to be carried on in the cylinder itself. During the first down stroke the charge is sucked in, compressed during the succeeding up stroke and ignited, expanded during the following down stroke, expelled during the next up stroke, after which the cycle repeats itself.

Both these types of engines have their exponents in well known machines that have been on the market long enough to demonstrate their reliability, and opinions seem divided as to which of the two is the better, taking everything into consideration. Other things being equal, it appears that where saving in weight alone is the main object the two-cycle with its impulse every revolution would be preferable; but the gain in power per cylinder is not what would be expected, as the compression and consequent M. E. P. is not so great as in the four-cycle. Moreover, the enclosed crank space adds more weight to the engine, thus further reducing the advantage.

The matter of weight for a given horse-power varies very considerably among the different designs made in this country, some engines being more particularly adapted to racing and others to general work; some makers make engines of different weights to meet the various conditions. Foreign motors, as a rule, are lighter than our own, approaching more nearly the automobile scale of weights. Personally, I think that the reasonably heavy engine is a much healthier development than the extreme racing machine. It seems that we save enough in dispensing with boiler, stack, condenser, auxiliaries, piping, etc., to make a decent allowance to engine weight possible.

As the installation of the fuel tank and supply pipes has much to do with the safety of the vessel, the most important points to be observed will be noted briefly. Tanks are properly made of heavy copper, with riveted and soldered joints. All connections for fittings should have flanges on inside and outside to prevent tearing the copper. A number of baffle plates must be fitted to control the motion of the oil when the vessel is in rough water. The tank is generally located in a peak compartment, but occasionally near the center of the vessel. In either case, the space in which the tank is placed should be carefully ceiled, and the tank made an accurate fit by peining the sheets to shape in place before assembling them; this prevents any bulging in and out of tank sides, which is bound to make leaky joints eventually. The tank compartment generally has a water-tight bulkhead on each side of it, and in many instances is flooded by having a number of holes through the planking in the region of the waterline. An alternative to flooding the tank compartment is to work a flat across underneath the tank, this and the sides of the compartment being sheathed with copper to a considerable height, thus forming a pan, which is given an overboard drain by pipes carried down and out through the side. The compartment may also be flooded if desired. In both methods the prime object is to provide an escape overboard for the gasoline in case of leakage or accident. As in any event the tank bottom should not be lower in the vessel than the vaporizer in order to secure a flow even with a small quantity of oil in the tanks, possibly the method in which a flat is worked under the tank is the more logical, particularly as it should result in absolutely freeing the bilge from any danger of gasoline vapor or fluid. The supply pipe from tank to vaporizer should have a cut-off valve just outside tank, and before entering vaporizer. The pipe should run directly down from the tank, out through the planking close in to the keel and then direct to the location of the vaporizer, where it will re-enter the hull. Naturally, extreme care should be taken in making up all joints in this piping, and a careful test should be made of the whole system when completed. The tank space, as well as engine room, should be well ventilated. As gasoline vapor is heavy, any system by which the air in the bottom of the compartments is sucked out would be the most effective. This would apply particularly to installations on vessels of some size with enclosed engine rooms. If the precautions suggested are taken, the danger from

Eight-Cylinder, Two-Cycle, 120 H. P. Leighton Engine.—Plate 1.

110 H. P., Six-Cylinder, Four-Cycle Standard Engine—Starboard Side.—Plate 2.

110 H. P., Six-Cylinder, Four-Cycle Standard Engine—Port Side.—Plate 3.

explosion of gasoline should be very small, and has been found so in actual practice, nearly all accidents being directly attributable to carelessness in installation.

The charge is, in most instances, ignited by an electric spark, as before stated, this spark being generally produced by a break in a low potential circuit of primary cells or a magneto machine, thus causing an induced spark of high tension in the cylinder space by means of a regular jump spark arrangement with Ruhmkorff coil, one terminal being grounded to the engine casting and the other connected to a well insulated electrode projecting into the cylinder space. The timing of the spark in the stroke effects the speed, and in all properly designed engines is capable of considerable adjustment. In all cases, except when starting, it must occur before the end of the compression stroke, and for maximum speed the highest pressure

should be reached just as the piston starts on the down stroke. At higher speeds the time of sparking must be set earlier in the stroke than at the lower, to allow sufficient time for thorough ignition. In some installations a dry battery is used for the initial sparking, and when the engine is once started the battery is cut out and a magneto driven off the engine thrown in, thus reducing the drain on the batteries. The electric wires must not be run low in the bilge, where they would be affected by dampness or water, or where a spark from a bad connection might ignite escaped gasoline vapor. The batteries, terminals, magneto and all electric connections must be well protected from dampness and spray to insure proper working. All wire connections to terminals, as far as possible, should be soldered, and binding screws should have locknuts to prevent them from jarring loose through vibration. In those engines

in which the electric spark is not used as the means of ignition, a tube heated by a flame to the proper temperature starts the combustion, this method being employed by at least one well-known maker. Some launch owners prefer to use a storage battery instead of the customary dry cells, and one of the 1,000 mile automobile batteries will last the greater part of a season for this purpose with ordinary use. By having a spare bat-

which revolve the individual blades on their axes. The fact that the engine must be run continuously during the changing from going ahead to reversal makes it evident that a method of governing should be provided to prevent racing during the change in load. This continuous running of the engine during short stops, when making landings, going alongside other boats, and, in general, when quick and positive starting is required, is,

as a rule, quite objectionable, owing to the noise and vibration usually caused under these conditions.

The speed of the engine is altered by changing the timing of the spark, as already stated, and also by throttling the gas supply. In all good designs both means of speed control are provided, and the throttle in addition is actuated automatically by a governor driven off the engine to prevent racing under release from load when stopping or running in a seaway. By a combination of these methods, and by the use of warm air, a large range of speeds and a considerable variation in the consumption of gasoline per H. P. hour is possible. Under the best ordinary conditions, when the gasoline vapor is in the proper proportion, the consumption does not vary greatly from one pint per horse-power hour, and this is the figure generally used in calculating tank capacities.

The heat produced by the high temperature of the products of combustion is drawn off by circulating water from the sea driven by a pump from the engine, the cylinders being well jacketed for this purpose. In some cases after passing through the jackets this water is discharged directly overboard, and in others it enters the exhaust pipes and passes out with the consumed gases. The latter method is preferable, lowering as it does the temperature of the exhaust line and reducing the back pressure, and having also the effect of securing a less noisy exhaust. Some form of muffler tank or expansion chamber is generally fitted in the exhaust line to deaden the sound of exhaust; diaphragms of different designs are sometimes introduced in these tanks to assist in the muffling process, but they have

Speed Launch Adios at 23 Miles an Hour.—Plate 8.

tery on hand of this description, there seems less chance of trouble than with the primary cells, which have a way of running down unexpectedly. In any case there should always be a reserve to fall back on in the event of a good spark not being produced.

In practically all the gasoline engines now on the market, with one notable exception, an initial charge must be drawn into the cylinders by cranking the engine over by hand before an explosion will be produced and rotation commenced, and when the engine is so started it runs continuously in one direction, reversal being impossible. Accordingly, to make it possible to stop and reverse the propeller, either the connection between the engine and the wheel must be by gearing, or a feathering blade must be used in which the pitch can be altered at will by the engineer. The first method is the most frequently used perhaps, and by many is considered the more reliable, several very substantial and positive friction gear clutches being on the market, so arranged that by manipulating a lever the tail shaft and crank shaft may either rotate as one or in opposite directions, or the tail shaft may remain idle while the engine turns over. Several very simple and effective feathering wheels are on the market also, and give excellent results, the pitch of the blades being altered at will from a maximum go-ahead pitch, through zero, to a maximum backing pitch with the same direction of rotation of the shaft. The shafting in such cases is hollow, and a rod within it controls levers on the hub

Speed Launch Standard at about 21 Miles an Hour.—Plate 11.

the effect also of raising the back pressure. Discharging the gases below the waterline, a device sometimes adopted for deadening the noise, and keeping the discharge where it will not be noticed, also increases the back pressure as do the numerous unnecessary bends in the exhaust line that may often be found when the installation has been carelessly made.

In appearance the many makes of gasoline engines are not dissimilar, and one becomes familiar with them through the illustrations crowding the advertising pages of all the present publications, even if not having had any actual experience with the engines themselves. A cut, Plate No. 1, is shown of an engine of the two-cycle type, manufactured by H. J. Leighton, of Syracuse, and two, Plates Nos. 2 and 3, of a new design four-cycle engine, made by the U. S. Long Distance Automobile Company, called the Standard Motor. The inclosed crank case of the two-cycle is clearly contrasted with the steam engine effect of the four-cycle machine, although in certain four-cycle engines the crank space is inclosed by a non-air tight case to confine the smoke from heated oil, etc., the air supply being taken from this space. The 120 H. P. Leighton and the 110 H. P. Standard engines appearing in the illustrations, are familiar to all those interested in the sport of racing power boats, both being installed in very fast hulls, the particulars of which will be given later.

As the Standard engine in question was placed before the public for the first time this summer, being the outcome of years of experience in such work by the Riotte brothers, and as it possesses many novel features, and is considered to be one of the most rational and well-worked out gasoline engines now on the market, a description of its principal points of interest will be given. The cuts show the general construction very plainly. The six cylinders are each of 8 inches in diameter by 10-inch stroke, and are cast in groups of three, bolted together in the middle. The valve chests are bolted to the back or starboard side of the engine, and contain the inlet and exhaust valves with their controlling rods. The engine bed consists of heavy fore-and-aft rolled sections to which are bolted the cast steel cross framing carrying the bearings. The engine columns are forged and cross braced, and the whole, with the exception of the 24-inch fly-wheel, is not unlike a marine steam engine in appearance.

The weight of engine, as shown in the illustration, is 3,200 pounds, a very heavy weight when compared with automobile engines, but not excessive for marine work, particularly when one realizes the enormous saving in the weight of boilers and auxiliaries necessary for a steam plant and not required for gasoline. The length over the bed, including fly-wheel, is 77in., and the height from bottom of fly-wheel to top of cylinder heads is 50in. The starboard side shows the large exhaust leads running from the bottom of the valve chests down to the main exhaust line, which runs aft to the muffler in the stern of the boat. The supply pipe is seen in this view running along the top of the cylinders, the inlet from the vaporizer joining this lead opposite the second cylinder from the fly-wheel end of shaft; the vaporizer does not appear in the cut, but is situated in the boat directly below this inlet. At the after end of the shaft is shown a pump which supplies compressed air to a reservoir in which the pressure is carried at about 150 pounds. This compressed air is used for starting engines and manipulating them in close quarters being led into a supply pipe controlled by a throttle feeding the three forward cylinders, just below the gas supply. The main cam shaft (which is the upper shaft with a pinion at one end) and the auxiliary cam shaft (the shorter one below the main shaft) control the inlet and exhaust valves for vapor and compressed air, respectively, by means of cams, the main cam shaft being rotated by a two-to-one worm and miter gear from the engine shaft. These shafts each have two sets of cams, one for ahead work, the other for reversal, a motion of translation along their axes permitting either set to be in action as desired.

A horizontal lever working over a notched quadrant controls this motion of the cam shafts and also the compression valves, while a continuation beyond the fulcrum closes the sparking circuit when thrown hard over either way. The valve to the compressed air reservoir being open the engine will start up ahead or astern when the horizontal lever is moved from the center notch on the quadrant to the first notch to starboard or port, respectively, the compression being released when the lever is moved from the central position either way. The engine can now be run for a considerable time under the air pressure, which is carried at 150 pounds, while 5 pounds is sufficient to turn over with no compression. A vertical lever close at hand regulates the timing of the spark, and the throttle to the gas supply which works over a calibrated arc is near the latter. The needle valve at vaporizer being set, and the horizontal lever being thrown over to the extreme notch on the quadrant, the engine commences to run as a gas engine, the rate of turning being directly controlled by the spark lever and gas throttle, and the direction of rotation depending on which side of the quadrant the lever is set. Thus the operations of starting and stopping are very similar to those required in the control of a steam engine; the cam shaft and air and gas lever corresponding to the valve gear, and the speed regulating devices corresponding to the throttle.

After a considerable experience with this engine, I have not once seen or heard of its failing to function promptly and properly when called upon, and believe that the control is most satisfactory. The manner in which the builders handle the boat in tight places around the water front is conclusive evidence of their confidence in the arrangement. The water circulating pump is under the air pump, and supplies the jackets through the riser shown between the two central cylinders on the port side with a branch to each cylinder. The jacket circulation escapes into the exhaust pipes through small tubes extending some six inches down into these pipes, thus cooling the exhaust line. All the mechanical details of the engine are carefully worked out, the bearing surfaces are large and well lubricated, and the parts of the several cylinders are interchangeable. The engine runs with almost a complete absence

of vibration, merely a scarcely perceptible tremor, and the fact that continuous running during the process of stopping and reversing, as well as the necessity for friction clutch and gear or feathering wheel are done away with, and complete control secured with rotation of the shaft in either direction without the use of gearing, are all points much to the credit of this engine.

The most interesting phase perhaps up to the present of gasoline engine use has been in the various types of racing launches, and a description of a few of these will not be out of place. Mr. H. T. Leighton, the manufacturer and designer of the 120 H. P. two-cycle engine shown in the illustration, has turned out a great number of very fast boats. The Adios, in which the engine just mentioned is installed, is his highest powered boat, and is credited with a speed of over 24 miles an hour. An official test over measured mile gave her 23 miles and a fraction, and since then her performance has been improved. Her particulars are:

Length—	Over all	55ft. 0in.
	L.W.L.	55ft. 0in.
Beam at L.W.L.		5ft. 6in.
I.H.P.		120

The engine makes 475 R.P.M., and the wheel is 3-bladed, with 32in. diameter and 72in. pitch. From this it will be seen that her performance is excellent. Photographs, Plates Nos. 8 and 9, are reproduced showing the wave formation from a broad side and a stern view, taken at about 23 miles, and show remarkably little disturbance of any kind, and prove that the design is a good one for the given conditions. Two additional Leighton launches are

	ZAZA.	
Length		35ft. 0in.
Beam		5ft. 4in.
Speed		18 miles
I.H.P.		25

	PINK.	
Length		22ft. 0in.
Beam		4ft. 0in.
Speed		14.8 miles
I.H.P.		7

All of these launches are more or less on the conventional flat-stern torpedo-boat model, and the approximate lines of the Adios are shown in Plate No. 4, the others not being dissimilar in general character.

The most conspicuous power boat in the neighborhood of New York harbor at the present is the Standard, in which is installed the engine of the same name previously described at some length. Her speed is somewhat problematical, her builders not having been satisfied with the wheels used this season and not having wished therefore to run her over an official course. Judging from what has been seen of her performance it is safe to say that she can run along very handily at 20 miles, and probably will reach 22 with a proper wheel. Her particulars are:

Length on waterline	58ft. 0in.
Beam extreme	7ft. 6in.
I.H.P.	110
R. P. M. about	400

Two photographs are reproduced, Plates Nos. 10 and 11, which show clearly the small wave disturbance produced by this hull, the flat wake being most noticeable, as well as slight bow wave and change of trim. The approximate lines of this launch also are shown, Plate No. 5, and are worthy of notice, as is also her construction. This launch was designed and built by the Marine Construction and Dry Dock Company, of Staten Island, to whom I am indebted for the drawing given. The general form of this launch is not unlike that used by Normand in his high speed work, and undoubtedly is well adapted to the purpose, as it drives well both in smooth and rough water.

The contour below the waterline is nearly straight from the greatest depth at the forefoot to the bottom of the transom aft, the necessary lateral plane for steady steering being secured by a false deadwood. The stern is chopped off straight up and down, the transom being wedge-shaped, which seems to have the effect of making a vessel leave the water more cleanly than the square-across transom. All the sections, except those well forward, where considerable flare is given to make her dry, are quite round, and the center of gravity of the load-water plane is well aft of the center of length. Her design is not in any sense extreme, and her lines could be used to advantage in larger vessels.

On a recent run to Nyack and back from the Columbia Y. C. in half a gale of wind, the water being very rough, particularly in the shallows near Nyack, the trip up and back, about 40 miles, was covered at an average rate of about 19 miles per hour; this with the engines somewhat throttled down. Under these trying conditions she behaved remarkably well. The engine required no attention whatever from start to finish, notwithstanding the heavy strain imposed upon it by driving through the seas, and the constantly varying load as the seas passed under her counter. The hull proved exceptionally dry under the circumstances, and there was no difficulty in steering, even with a quartering sea. No evidences of distortion of the hull while driving hard in a seaway have been noticed, although the construction is exceedingly light, as will be seen from the detailed description that follows.

There are three small cockpits about four feet wide, being used for steering, engine space, and passengers, respectively, commencing forward. One gasoline tank is carried forward in the peak compartment and another aft of the engine compartment. The method of construction is novel. The planking is of 3-16in. mahogany, worked in one thickness in planks about 11in. wide, flush. The seams of these planks are centered on fore-and-aft strips about 2in. by 1in., each plank edge being secured to these strips by brass wood screws, let in flush and closely spaced. The timbers are spaced 8in. centers except toward the ends where the spacing is more open. They each consist of two narrow steamed oak strips about 3/4in. by 1/2in., one on each side of the longitudinal strips, being let into and secured to these strips. Rigidity is given to the hull in a fore-and-aft direction by a truss running along each side of the line of the cockpit coam-

ings. The upper and lower members of these trusses are of wood of substantial dimensions, and the compression members are of gas-pipe, the cross bracing being made of several strands of steel wire, twisted to produce the required tension by means of a metal rod lashed to prevent the twist coming out, and allowing adjustment if required. As stated, the hull is sufficiently rigid to withstand the strains produced without undue distortion, but the extreme thinness of wood between one's self and the water, when driving at high speeds, is an unpleasant subject of thought, when the effect of running into any floating spar or wreckage is considered. About the only trouble experienced with this hull has been the tendency of the planks to buckle, as there is no way of taking up the expansion, the seams being a neat fit. As the plank is screwed on it can be removed when required and the seams and edges eased off.

The success of the flat-sterned launches with the center of gravity of the load water plane well aft has led to many peculiar developments in the way of freak designs, with some of which remarkable results have been obtained.

Western Ice Yachting.

THE ice yachtsmen along the lakes are beginning to get busy. For some time past, a number of prominent Cleveland ice yachtsmen have been discussing a new boat that has been purchased by Mr. D. Perkins. She is one of the fastest yachts that has ever sailed the lakes, and for three years was invincible at Put-In-Bay, where she was formerly owned. Gee Whiz has been placed in commission; Mr. Wm. Shipman is fitting out Jack Frost, and Newell Bros. are at work getting Queen Lil in shape. Mr. Earl Van Scoit will have his new boat in shape within a few days, and Mr. Wm. Devereux, who has been hard at work for two months past, will be in the game within two weeks.

Detroit yachtsmen are also preparing for a successful season, and the river is already frozen 4in. thick. By the time the sport is on in earnest there will be fifty boats sailing on the river and Lake St. Clair. The Detroit Y. C. is building six new boats, which will be ready for delivery within a week or ten days. They are being built under the direction of Messrs. Andrew Kramer and Casper Schmidt. Among those building are Capt. Rogers, Messrs. Matt Kramer, Archie Michie, Chas. Bray and P. Moran, making a total of eleven new boats in this club.

The yachtsmen of Kalamazoo are actively at work and will soon be ready. Its annual regatta will be held from Jan. 19 to 23, inclusive. The following schedule has been announced:

First Race—International Championship, 450 sq. ft. canvas limit; best three out of five heats, without handicap. The Hearst International Championship, presented to the ice yachtsmen of America by W. R. Hearst.

Second Race—International Championship, 850 sq. ft. canvas limit; best three out of five, without handicap.

Third Race—Michigan State Championship, 850 sq. ft. canvas limit, without handicap.

Fourth Race—Sweepstakes, \$150 purse, divided in \$60, \$40, \$30 and \$20. Handicap race free for all.

Fifth Race—Consolation race, \$50 purse, divided \$25, \$15 and \$10. Handicap race, free for all who have not won any prize. One heat.

C. W. SCHMIDT, JR.

Columbia Y. C.

THE Columbia Y. C., of Chicago, held its annual election Saturday, Dec. 5. Mr. Fred. A. Price, owner of the racing yachts Vencedor and Little Shamrock, was chosen Commodore; Charles E. Soule, owner of yawl Naiad, Vice-Commodore; Henry R. Davies, owner of Iroquois, Rear-Commodore; Louis T. Braun, was re-elected Secretary; M. H. Hickey, owner of Iris, Treasurer, and J. F. Adams, owner of Columbia, and C. J. Duggan were selected to act as directors with the commodore, secretary and treasurer.

The coming season will be formally opened May 28, and will be continued well into October. The principal events being the Michigan City race, June 11, this being the thirteenth annual; the open regatta, July 2 and 4; Lake Michigan Y. A. annual meet at Macatawa, July 29 and 30, and the race of 100 miles across Lake Michigan from Chicago to Macatawa, starting at 7 P. M. Friday, July 22; the Sir Thomas J. Lipton Competitive cup races, Aug. 13, 14 and 15; the races for the Thos. H. Webb cups, and the McGuire cup, dates for which have not yet been set, and the great meets at Detroit from Sept. 5 to 12. The Detroit Y. C. holding its annual fall regatta on Labor Day, Monday, Sept. 5; the Country Club holding a match race on the forenoons of the 6th, 7th and 8th for its crack inland laker Red Coat, the successful Seawanhaka cup defender, now owned by Russell Alger, Jr., and the Columbia Y. C.'s Pats, owned by Wm. Lorimer, Jr., and which won third place at the Inland Lake meet, held at Oshkosh, Wisconsin, last August, and in the afternoons of the same dates the races of the 20ft. cabin class for the Country Club Competitive Cup, for which event the entire Columbia Y. C.'s fleet of 21-footers are to start. On the 10th the Country Club will pull off their annual fall regatta, and on the 12th the Detroit Y. C. will hold their great annual sweepstakes, for which the Vencedor will compete. The Country Club is trying to arrange a match between the Vencedor and Irondequoit, of Rochester. Com. Price has already consented to arrange such an event, and it is now up to Com. Van Vorhees, of Rochester, to complete arrangements. The regular fall regatta will probably not be held until Saturday, Oct. 1, in order to keep up the interest in the racing game until late in the season.

The little tramp steamer Scythian that Miss Susan de Forest Day used as a yacht for several years, has been sold to the Haytian Government and is now being converted into a gun boat. The vessel will receive her armament in New York, where she now is, and afterward will proceed to Port au Prince.

Boston Letter.

Boston, Dec. 14.—There now seems to be every prospect that a class of 30-footers will be formed in Massachusetts Bay. In fact an association has been formed, or is about to be formed, for the purpose of furthering this class. Circulars are being gotten out, giving the restrictions of the new class. This is not the 30-rating class, which was proposed in the Yacht Racing Association of Massachusetts by Mr. Louis M. Clark, but has been formed by Marblehead yachtsmen. It is understood that the yachtsman who fostered the class is Mr. Thornton K. Lothrop, Jr., who became prominent among racing yachtsmen through his ownership of the 21-footer, Little Haste, and the 25-footer, Great Haste. It is understood also that there are other yachtsmen, who at present own 25-footers, who are interested in the new class and will build yachts for it.

Those who have been interested in the formation of the class, have gone about the matter very quietly, and, up to within a very short time, there were few who knew anything about a definite movement toward this end. The new class will be governed by scantling restrictions, as was the old class of Y. R. A. 30-footers, the racing measurement being taken from the waterline length and a fixed limit of over all length specified. It is understood that the limit of over all length is placed at 50 feet. For modern yachts this gives a comparatively reasonable amount of overhang. It is less, in proportion, than those of the 22-footers, which are also limited, and infinitely less than those of the 25-footers which raced last season, whose over all length was not limited. These boats will probably be of moderate form all over, as it is understood that the sail area is to be quite moderate, something about 1,250 square feet. There was a provision requiring at least 5,000 pounds of outside ballast. This amount seems quite small for boats of such a size, and it may be possible that the rule has been changed. Full headroom is required in the cabin, although there was some talk of having the amount of fittings optional with the owner.

The fact that an association to govern such a class has been formed, at a time when a 30-rating class has been suggested, would seem to indicate that Massachusetts yachtsmen are not quite yet ready to take up a rating rule. The fact that those who have become first interested in the new class are in some cases owners of existing 25-footers, may have some bearing upon the racing of the latter class next season. All of the 25-footers are understood to be now in the market, and they may find new owners before the season opens. A very recent rumor is to the effect that even if these boats are not disposed of, they will not be raced by their present owners. It is believed to be the intention to bring the new association governing the 30-footers before the Yacht Racing Association of Massachusetts and requesting the greater body to adopt the class, as was done in the case of the 22-footers and the 18-footers.

If this class should receive any amount of patronage it is practically certain that the proposed 30-rating class will have to go over until some future time. There will be a great amount of satisfaction in having some class of 30-footers started, for it may be the means of bringing back an interest in still larger classes. There now seems to be more prospect of racing yachts of 30ft. waterline than there has been since 1899.

With the 30-footers racing and the 25-footers out, there will be five restricted classes in next season's events. The 22-footers will undoubtedly race and the 18-footers are more numerous than ever. There will be a fair amount of 15-footers. The development of the new 21ft. class is a little slow yet, but it is thought that it will become well patronized when the yachtsmen have found out the value of the restrictions.

JOHN B. KILLEEN.

Interlake Yachting Association.

THE tenth annual meeting of the Interlake Y. A. was held in the club rooms of the Toledo Y. C. at Toledo, Ohio, Saturday, Dec. 5. The attendance was large and enthusiastic, all of the ex-commodore, with one exception, and more than forty delegates, being present. During the banquet, which preceded the meeting, speeches were made by the commodores and many of the prominent fresh water yachtsmen, in which the growth and progress made and the favorable outlook for the future were freely discussed. At the conclusion of the festivities, the meeting was called to order by the commodore, Henry Tracey, of Toledo. The following officers were elected to serve for the coming year: Com., John H. Smedley, Detroit B. C. Y., of Detroit; Vice-Com., W. C. Sterling, Monroe Y. C., of Monroe, Mich., and Geo. W. Mayham, of the Buffalo Y. C., of Buffalo, N. Y. Mr. H. Coy Glidden, of Detroit, was elected secretary and treasurer; Chas. P. Sider, of Detroit, was elected measurer, and Dr. J. P. McInnes, of Toledo, fleet surgeon. There was a contest for places on the Regatta Committee, after which the following were elected: Mr. Mark W. Allen, of Detroit, and Mr. John A. Rathbone, of the same place; Mr. E. E. Pettibone, of Cleveland, O.; Mr. Wm. E. Seitz, of Sandusky, O., and Mr. Joe Grasser, of Toledo. Mr. John L. Dexter, of Detroit, was re-elected chairman of the Entertainment Committee. Three delegates to represent the Interlake at the Yacht Racing Union of the Great Lakes, were also chosen. Mr. John A. Rathbone for the long term, two years, and Dr. Jennings, of Detroit, and Mr. Myron B. Vorce, of Cleveland, for the short term. The union embraces the Lake Ontario, Lake Michigan and Lake Erie (Erie, St. Clair and Huron) divisions.

Dr. Jennings then made an eloquent appeal to have the association adopt the new 21ft. restricted class that had been adopted by the Country Club of Detroit. After considerable argument the matter was referred to a committee, for its investigation, said committee to report its findings to the association within thirty days, when it will be acted on by that body.

The new 21ft. class adopted by the Country Club, of Detroit, is the same as adopted by the Columbia Y. C. of Chicago, a class that proved very successful in its races for the Sir Thomas Lipton trophy. The object of the class is to promote inter association racing. Last season two boats were built, and at present four

are under process of construction. Mr. E. L. Ford heads the list with a likely looking craft, which is nearly completed. She was designed and is being built by Joseph A. Pauliot, who turned out Hoosier, which competed in the Lipton races at Chicago, and is practically an improvement on the latter. Mr. Kenneth Stevenson, of Detroit, is having one built, which is from the board of Messrs. Burgess and Packard. Mr. E. Bryan, of Detroit, is also preparing to get in the game, with one from designs by E. J. Kistenmacher, of Davenport, Ia, while a syndicate composed of members of the Country Club are considering several designs, one of which will be selected and built in time for next year's racing. Mr. Harry Wheeler, of Cleveland, has laid down a boat in the same class, designed by himself, which will be completed early in the spring and be raced at Detroit and Chicago. Mr. J. W. Marshall, of Toledo, will also build for the class, and has plans from an eastern designer.

Alert.

LAST season Alert was raced in almost all the contests where there was a class for her. As defender of the Manhasset Bay Challenge Cup, Alert was successful, winning two firsts and one second, out of the series of three races; this showing was made against a large field, there being eight starters in these races. Alert won the championship pennant of the Y. R. A. of Long Island Sound for the 30ft. class, and at Shel-

ALERT.

Designed and built by the Herreshoff Mfg. Co. Owned by J. W. Alker.
Photo by Tieman, New York.

ter Island she not only won her class cup, but also the Maxwell Cup, which was raced for by sloops of all classes from 30 to 51ft. Alert finished the season on Sept. 19-20 by winning the Atlantic Y. C. Cup for the 36ft. class in a series of three races.

Alert was designed and built by the Herreshoff Mfg. Co. in 1902. She is 42ft. 6in. over all, 28ft. 6in. waterline, 9ft. 6in. breadth and 4ft. 2in. draft. Alert is a combination keel and centerboard boat, and she carries 1,150 sq. ft. of sail. She is owned by Mr. James W. Alker, of the Manhasset Bay Y. C., who sailed her in most of the races.

An All-Around Small Boat.

Editor Forest and Stream:

Wishing to have a boat that would carry only one person, and one that I could use either as a canoe, a rowboat, or a sailboat, some time since I got a number of half-inch cedar boards, 14 inches wide, at a sawmill down in South Jersey, and built a bateau 11 feet in length and 32 inches in width, with the thwart set very low. The lumber, after being planed, was less than 3/8 of an inch in thickness. The boat when finished looked so neat and trim and pleased me so well that I built another of the same dimensions as the first; one of which I have up at the "Little Bresh" hut at Oakledge, and have used it during several summers on the lakes and streams in Connecticut; the other I have used on the streams and on several good sized lakes around here—Milhurst, New Jersey.

As a canoe I use each with either a single or a double blade paddle. As a rowboat I have for each a pair of very light steel oarlocks and blocks, and a pair of short oars; and as a catboat I have for each a rudder and an adjustable keel 10 inches deep, mast 12 feet in length set well up into the eyes of the craft, a boom 11 feet in length, and a triangular or leg-of-mutton sail of heavy muslin, with 11 feet hoist and 11 feet along the foot, with two rows of reef points. Each boat will weigh about 50 pounds. As a canoe with myself and duffle aboard, each will float where a musquash can swim, as Nessmuk said; consequently one can navigate a very shallow lake, or go up or down a small stream in it.

When they are used as catboats they will stand up far better under a stiff breeze than anyone would suppose, and it is surprising to see how fast they can travel either before the wind, going free, or close hauled, and they will hold their own with many much larger sailboats.

I have spent many enjoyable days with the two little boats either in the capacity of canoes, rowboats, or sailboats. When used as canoes I like either of them fully as well as any of the regulation pattern that I have paddled, and I have used many different ones.

A. L. L.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Mr. Frank A. Wilmet, of Bridgeport, Conn., has sold the auxiliary yawl Hussar II., through Mr. Stanley M. Seaman, to Mr. George H. McNeely, of Philadelphia, Pa.

The officers of the Sea Gull Y. C. are as follows: Com., Fred Voettler; Vice-Com., Charles Seib; Sec., Joseph Imhof; Fin. Sec., Joseph Hesse; Treas., William Henry; Sergeant-at-Arms, George Fuess; Trustee, Henry Hamm. The organization has been in existence four years, and has a well-equipped club house at Sand Bay, Canarsie. The membership at present is limited to sixty, with about twenty on the waiting list.

The annual meeting of the Pavonia Y. C. was held in Franklin Hall, Jersey City, on Tuesday evening, Dec. 8, and was attended by one of the largest gatherings of members seen in recent years. While some disappointment was felt at Com. Lyne's repeatedly declining a renomination, for the reason that he will have to give his business closer attention next year, it was felt that the club had secured an excellent commodore in Walter A. Ward, owner of the steam yacht Chief, and who served as vice-commodore during the year just completed. The full ticket elected Tuesday night was as follows: Com., Walter A. Ward; Vice-Com., E. H. Moore; Fleet Captain, J. H. Fermier; Fin. Sec., W. F. Tobin; Cor. Sec., H. Smith; Treas., Charles F. Crane; Meas., A. P. Curtis; Fleet Surgeon, W. J. Parker, M. D. Board of Trustees: W. D. Salter, L. F. Lyne, E. J. Smith, F. G. Agens and A. L. Koerner. House Committee: D. A. Woodruff, C. Smith, D. Allan, Jr., W. Willis and A. F. Roe. Delegates to the American Power Boat Association, W. A. Ward and L. O. Coder. On New Year's Day, 1904, the newly elected officers will give a dinner to the members of the club and their friends at the club house. At this dinner the plans of the club for the season of 1904 will be discussed and decided upon.

The firm of Messrs. A. Cary Smith & Barbey will be dissolved on January 1 by mutual consent. Messrs. Tams, Lemoine & Crane have taken Mr. Barbey into partnership, and Mr. Smith has taken Mr. Theodore E. Ferris into partnership. Mr. Ferris was formerly in Mr. Smith's employ, but for several years past he has acted as Superintendent of Construction for the Townsend & Downey Co., at Shooter's Island, S. I.

A class of one-design boats will probably be built during the winter for members of the Indian Harbor Y. C., from plans made by Mr. Morgan Barney.

The annual meeting of the Shrewsbury Ice Boat and Yacht Club was held at Pleasure Bay, N. J., on December 4, and the following officers were elected: Com., Edward W. Reid; Vice-Com., William A. Seaman; Recording Sec'y, Harold Seaman; Financial Sec'y, Edward H. Green; Treas., John L. Price; Meas., Thomas Riddle and Harold Seaman; Regatta Committee—William H. Martin, Frank P. McLain, John White, John P. Lane, and C. H. C. Clark; Fleet Captain, G. P. Joline.

At a meeting of the Board of Trustees of the Corinthian Y. C., Charles H. Brock, W. Barklie, Henry and Charles Longstreth were appointed a committee to conceive some plan whereby an interest in small boat racing on the lower Delaware River could be increased. The committee decided on a one-design class similar to the Seawanhaka Corinthian Club's 15-footers as the most wholesome type. Their missionary work was so successful among the racing element of the organization that eight members have decided to build boats in time to race next spring.

These boats are to be handled exclusively by amateurs, and their rowing expenses are to be limited to a small cost per month. The committee has arranged for the boats to be built for a moderate sum, of single white pine or cedar planking, fitted with Wilson & Silsby sails and rigging complete, and with a water-tight bulkhead.

It is likely that the adoption of the little craft will awaken an interest in small boat racing among the members of the fleet. It is also likely to revive the dormant subject of interclub races between the Oyster Bay and Corinthian Clubs.—Philadelphia Item.

Members of the Manhasset Bay Y. C. have organized a new one-design class and ten boats have already been ordered. These clipper dories are being built by Mr. E. Gerry Emmons, of Swampscott, Mass., from designs made by Mr. Charles G. Mower. They are 21ft. 6in. over all, 15ft. 6in. waterline, and 6ft. breadth. The boats are to be substantially built, the keel and the frames to be of white oak, and the planking white pine. The standing rigging will be of steel, the blocks of brass, and the decks will be covered with canvas. The spars will be of spruce, and the boats will carry a gaff mainsail and jib. The dories will cost, freight on board at Swampscott, \$135, and freight, \$5; mainsail cover, \$3; 400 pounds of ballast, \$10; and a contribution to the prize fund, \$10, will bring the total up to \$163.

The Monroe Y. C. was organized at Monroe, Mich., two years ago, and has ever since figured conspicuously, though modestly, among the yachting organizations on the western waters of Lake Erie. A commodious and picturesque club house was built at the Monroe piers, which

Raven Run, Pa., Dec. 5.—William Sweeney, of Girardville, killed 5 out of 9 birds in a shooting match at Raven Run, and Michael Houghton, of the latter place, grassed 4 birds. The stakes were \$100 a side.

Interstate Association.

THE annual meeting of the stockholders of the Interstate Association was held at Oakland, N. J., Dec. 10, 1903, at 10 A. M., and adjourned to meet the same date at 1:30 P. M., in the offices of the Lafin & Rand Powder Company, 99 Cedar street, New York city.

The adjourned annual meeting was called to order at 2:10 P. M., President Bennett in the chair. Present: Union Metallic Cartridge Company, A. C. Barrell; American E. C. & Schultze Gunpowder Company, Ltd., Edward Banks; Winchester Repeating Arms Company, Irby Bennett; Parker Brothers, W. F. Parker; The Hazard Powder Company, J. T. Skelly; E. I. Dupont Company, Eugene Dupont; Lafin & Rand Powder Company, A. W. Higgins; Remington Arms Company, M. H. Dodge; The Marlin Fire Arms Company, J. Howard Marlin; Markle Lead Works, W. P. Markle.

The Peters Cartridge Company was represented by Mr. W. A. Higgins, by proxy, and Tatham & Bros., by Mr. W. P. Markle, by proxy. Mr. J. A. Haskell, of the Lafin & Rand Powder Company; Mr. W. L. Lyon, of Parker Brothers; Mr. J. D. Bethel, of the Marlin Fire Arms Company; Mr. James Hildreth, of the Winchester Repeating Arms Company, and Capt. A. W. Money, of the American E. C. & Schultze Gunpowder Company, were also present, as were Mr. B. Waters, of FOREST AND STREAM; Mr. W. R. Hobart, of American Field; Mr. M. R. Herrington, of Shooting and Fishing; Mr. D. F. Pride, of Field and Fancy, and Mr. Elmer E. Shaner, secretary-manager of the Association.

The minutes of the special meeting, held March 13, and of the annual meeting this date, at Oakland, N. J., were read and approved.

Mr. A. W. Higgins, treasurer, presented his report for the year ending this date. The report showed that the Association was in good financial standing, there being a substantial credit to the account of the Association. Upon motion, the report was received, approved and filed, and a vote of thanks was tendered the Treasurer.

The report of the secretary-manager was read by Mr. Shaner, and upon motion was received and filed.

PITTSBURG, Pa., Dec. 9, 1903.

To the President, Officers and Members of the Interstate Association:

Gentlemen—In presenting the report of the operations for 1903, I am pleased to inform you that the season now drawing to a close has been an unqualified success, eventful in good results for our members. The trapshooting world again has been given proof that the Interstate Association performs what it promises, and the interest displayed in our work convinces us of the great importance of our organized efforts thus far. At no time in our history have the benefits of organization been more manifest than now. In no way can the manufacturer contribute more to the general interest of trapshooting than by adding his influence and personal attention to the efforts of the Interstate Association, as it has been fully demonstrated that our methods are sound, logical and based on good judgment, the result of close study of the subject.

The records of this office, in entirety and severally, show that the sport of trapshooting is yearly growing stronger, and it will continue to increase just as long as it is conducted on the same clean lines as at present, under the guiding influence of an organization such as ours. The Interstate Association is recognized as the parent organization, and it is so mixed up in affairs in the trapshooting world that it has become an indispensability to the sport, which, to a large extent, depends on its existence. From the opening of the season to the closing tournament in the fall it outlines the policy of many gun clubs which pattern by it and follow in its footsteps, and it is to the credit of these clubs that they are fully able to appreciate its excellence.

Tournaments.

The opening tournament was the fourth Grand American Handicap at targets, held at Blue River Park, Kansas City, Mo., April 14 to 17. It was an epoch in point of attendance and enthusiasm. The entries received numbered 192. This is the largest number of entries ever made in any similar contest and is a monument to the wisdom and enterprise of the Interstate Association. It was a meeting long to be remembered by those who were so fortunate as to witness the superb skill displayed by the contestants who took part in the different events. The discipline was strict, and the result justified the tight rein, contributing to general satisfaction.

The tournament at Du Bois, Pa., May 13 and 14, for the benefit of the Du Bois Rod and Gun Club, was enjoyable and profitable to all concerned. There were thirty-three contestants and twenty-three shot through the entire first day's programme, and twenty-two in the second. The weather was all that could be desired, and first-class scores were the rule throughout.

The third tournament of the season's series was held in Williamsport, Pa., May 27, 28 and 29, under the auspices of the West

Branch Rod and Gun Club. The State tournament at Philadelphia the week previous, and the tournament of the Western Pennsylvania Trapshooters' League, at Brownsville, Pa., on the same dates, prevented the attendance of a considerable number of contestants who ordinarily attend at Williamsport. The weather also was unsatisfactory, clouds making successful shooting almost steadily problematical. Yet, despite all these discouragements, forty-four contestants took part and the tournament was pronounced a success. Interest was renewed, the results were satisfactory to local shooters, and our members have no reason to complain of the manner in which all things worked together for their good.

The month of roses opened auspiciously. The tournament at Boston, Mass., came off June 3 and 4, and though there were many adverse influences it was on the whole fairly satisfactory. The grounds at Wellington, a suburb of Boston, were in splendid condition, and only bad weather and apathy on the part of shooters who were not in evidence contributed to local disappointment. Forty contestants took part, which was about one-half the number expected by the Boston Shooting Association, under whose auspices the tournament was given.

The tournament at Warm Springs, Ga., June 16 to 19, was one of the best ever given by the Interstate Association. There were two days' rare sport at targets and two at live birds, and the attendance was much larger than expected, and all visitors left with a lively appreciation of Southern hospitality. There were contestants present from Georgia, Alabama, North and South Carolina, Tennessee and Maryland. Arrangements were complete and the weather unexceptional. In addition to all the absolutely necessary accessories to complete enjoyment, there was a large concourse of spectators present each day. This tournament, given under the auspices of the Meriwether Gun Club, was very successful in all respects, and especially in reviving interest in the sport in the Southern States. The local gun club handled its guests in a manner that gave perfect satisfaction.

The sixth tournament was held at Rutherford, N. J., June 24 and 25. The preliminary shoot to have been held on the afternoon of June 23, was abandoned on account of a heavy rain, which made it impossible, and the 24th opened with a drizzling rain, which prevented a number of contestants putting in an appearance. The rain ceased in the afternoon, but the pleasure was marred by a leaden sky, added to an east wind, which drove the smoke into the faces of the shooters. Notwithstanding forbidding conditions, thirty-four contestants faced the score, and twenty shot in every event, and fair success was achieved, despite all drawbacks. The conditions were very much better the second day, and the attendance was all that could be desired. Two sets of traps were kept going from 9 A. M. until dark, and some good work was done.

The attendance at the Huntsville, Ala., tournament, under the auspices of the Huntsville Gun Club, on July 8 and 9, was not as large as expected, but the event was a success nevertheless. The first day's weather was a poem, and the effect on the sport was exhilarating. The second day's attendance, both of contestants and visitors—and among the latter were many ladies, who added grace, interest and emulation—was much larger than on the first day. Interest was also added by a contest between the Huntsville and Sheffield gun clubs for a silver loving cup, the Huntsville club being the winner.

The Lacrosse, Wis., tournament, held July 30 to Aug. 1, under the auspices of the Lacrosse and Viroqua gun clubs, would a decade ago have been considered a notable event even for the Association's great annual event, the Grand American Handicap. Arrangements made both by the local and Interstate organizations were, humanly speaking, perfect. There was an unusually good attendance of spectators, and entries were record-breakers in anything short of State events. The first day there were over seventy names on the list, and on the second, eighty, and from opening to close the machinery worked perfectly, and all felt it was good to be there.

The Interstate Association and the Ottawa, Ill., Rainmakers' Gun Club, at the tournament, Aug. 12 and 13, gave an exhibition but rarely paralleled in the annals of sport, though the Rainmakers curtailed the business in the midst of the second day's work by sending a soaking shower. Great scores were being made when Jupiter Pluvius "pulled the plug" and drowned the play. The scores were good on both days, but there were too many counter-attractions at the date in the Western circuit to allow of a large attendance.

Our tenth tournament, at Akron, O., Sept. 2 and 3, had between eighty and ninety contestants in the lists, and the Akron Gun Club's arrangements and ample grounds and equipment assured a profitable time from the outset. The weather was superb and the shooting the same, both amateurs and manufacturers' agents making high scores, the former treading closely on the heels of the latter. This tournament was one of the big successes of the season.

Old Prob. marred the closing contest of the season, that at Scranton, Pa., Sept. 23 and 24. The Scranton Rod and Gun Club had done everything human foresight could do, but the threatening weather aspect kept the attendance down the second day. On the first day the crowd of spectators was so large that the contestants had trouble to get to the firing points when their turns were called. There were forty-eight entries the first and thirty-two the second day, and good scores were made, considering the drawback of a poor background.

The Future.

Never at the close of any season was the prospect for the future brighter. There is not a cloud discernible on the horizon. Members of our fraternity are, as a rule, above the influences which lead to bickering in many sports of other kinds. A love of clean, exciting, scientific and high-toned sport controls them, and the subsequent rivalry is of a generous nature, that has a tendency to create and keep up interest in the sport.

The Grand American Handicap at Targets for 1904.

The Grand American Handicap at targets has grown to proportions never even approached by any other similar organization, and as a matter of both pride and profit the Association cannot afford to allow it to decline. It is now recognized as the event of the year, and the greatest care should be exercised in its management. The place to be selected for holding it in 1904, should be carefully considered. A general discussion may be of vital importance. At the same time the very best of everything should be provided. On these much of our past success has hinged.

Minor Details.

Combining the offices of secretary and manager has increased my duties considerably, entailing a very large correspondence; but the matters dealt in were of such a nature that I do not consider a review necessary.

The properties of the Association are stored in Pittsburg, fully protected by insurance.

In Conclusion.

I wish to renew my thanks to our members for their generous support, and invariable kindness manifested through a long series of years, and solicit a continuance of the same, and in this I include the sportsmen's journals for their unfaltering support of both the Association and myself.

Very respectfully submitted,

ELMER E. SHANER, Secretary-Manager.

The secretary read an application for membership from the Chamberlin Cartridge and Target Company, the same being passed upon favorably, as was the application of the Sportsman for honorary membership.

The secretary also read a letter from the United Lead Company withdrawing the membership of the Le Roy Shot and Lead Works in the Interstate Association, the resignation being accepted.

Mr. Dodge moved, seconded by Mr. Skelly, that a committee of three or five be appointed to confer with the Associated Press, with a view of securing better service in its reports of shooting tournaments. The motion prevailed, and the president announced that he would appoint the committee at a later date.

By request, Mr. J. A. Haskell addressed the meeting in regard to increasing the scope of the Interstate Association. Mr. Haskell spoke at length, and commented on the great amount of good already accomplished by the Association, and suggested that it consider the advisability of giving a greater number of tournaments than in former years. Mr. Haskell is thoroughly in touch with the situation, as it applied to the Association's work. President Bennett, in a few well chosen words, thanked Mr. Haskell for giving the Association the benefit of his views on the subject.

A long list of applications for tournaments during 1904 was read and referred to the Tournament Committee, as were the six applications for the Grand American Handicap of 1904.

A resolution was introduced and carried, whereby at future tournaments given under the auspices of the Association, not more than two manufacturers' agents will be permitted to shoot in any one squad, providing the number of entries received at the tournament permits of this arrangement. The object of this is to prevent the manufacturers' agents clubbing together and shooting by themselves, thus taking away interest to a certain extent from other squads.

After a recess of ten minutes, the election of the Board of Directors for 1904 was proceeded with, which resulted in the election of Messrs. Irby Bennett, W. J. Bruff, A. W. Higgins, Eugene Dupont and Edward Banks.

On motion, the stockholders' meeting adjourned at 4:30 P. M. The meeting of the Board of Directors was called to order by

Event at 25 targets: Elias 6, Dr. De Wolf 15.

Owing to delay in arrival of pigeons, the tie will be shot off here during February shoot.

The Gold Lion cocktails manufactured by the Cook & Bernheimer Co., of New York, are made in seven kinds, and prepared with great care. The proportions of each ingredient are exactly weighed and measured, so that the cocktails are always the same. They are completely prepared, and need merely to be poured out of the bottle and iced before drinking.

TATHAM'S CHILLED SHOT
is the only kind safe to rely on to make an effective killing pattern, and it is worth while to take a little trouble to make sure you get it.

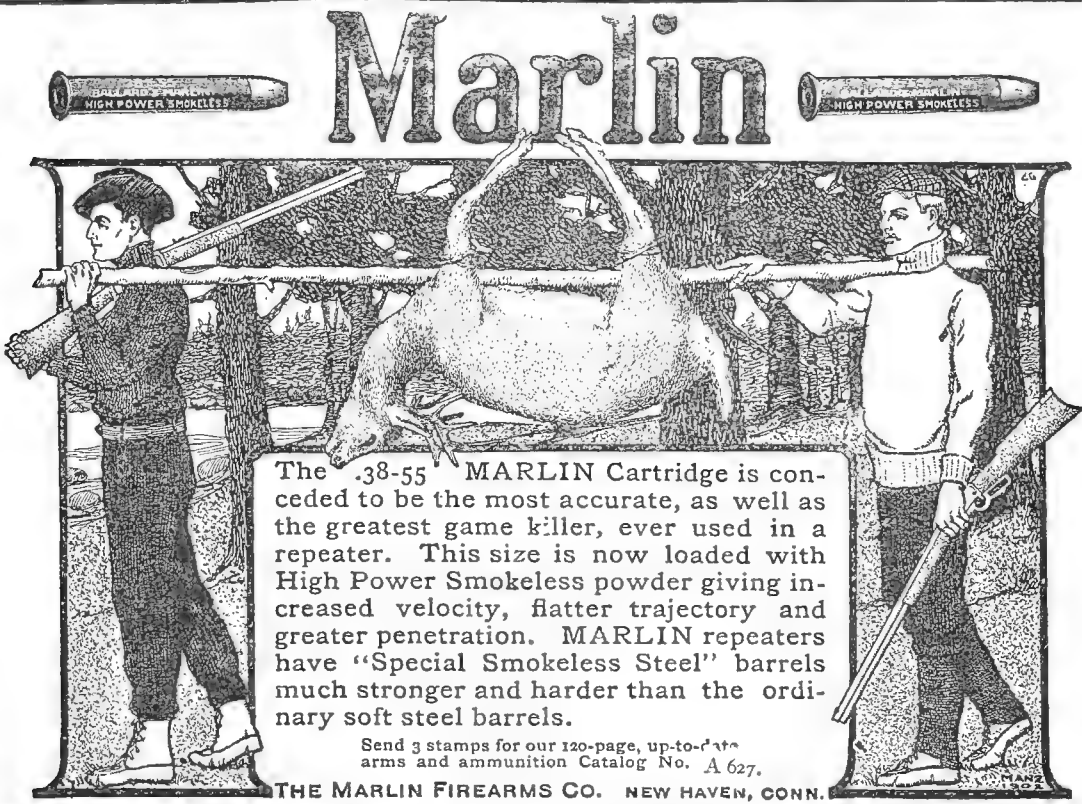

“INFALLIBLE”

At the tournament held at Raleigh, N. C., October 21, 22 and 23, High Amateur Average was won by W. P. Wittaker, of Raleigh, with a score of 314 out of a possible 355 targets.

This gentleman also won the Lyon Trophy, emblematic of the State Championship, with a score of 93 out of 100 targets. He used

LAFLIN & RAND POWDER COMPANY,
New York. Chicago. Denver. San Francisco.

Marlin

The .38-55 MARLIN Cartridge is conceded to be the most accurate, as well as the greatest game killer, ever used in a repeater. This size is now loaded with High Power Smokeless powder giving increased velocity, flatter trajectory and greater penetration. MARLIN repeaters have "Special Smokeless Steel" barrels much stronger and harder than the ordinary soft steel barrels.

ABERCROMBIE & FITCH

The Sportsman's Christmas

we hope will be a happy one, but the days and weeks preceding it may bear a certain measure of perplexity and worry.

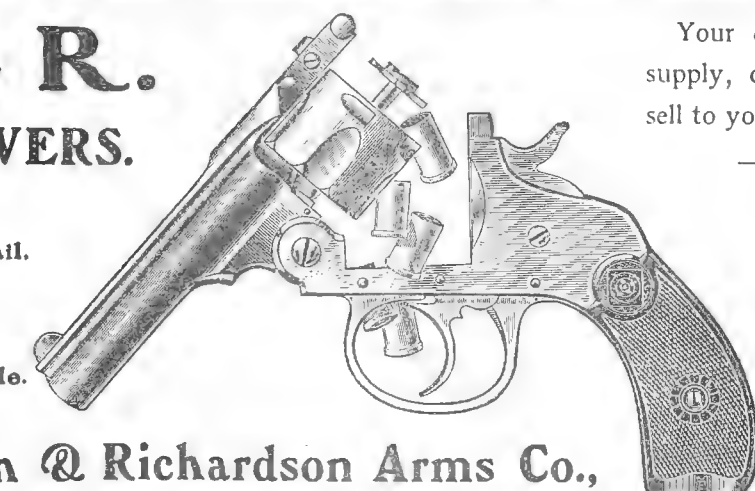

What gift is most likely to please the friend with whom he makes his annual fishing trip, or with whom he shoots? What article may add some measure of contentment to that cup of outdoor joy which—whatever it may be while being drunk—in retrospect always seems to have been so sweet.

He who may be suffering from such anxieties, will find his doubts resolved, if he will call on us and, with the articles before his eyes, select what seems to him best suited to the needs or the pleasures of his friend.

TWO NEW EDITIONS.

American Duck Shooting.

BY GEORGE BIRD GRINNELL.

The unexampled success of Mr. Grinnell's book on Duck Shooting has warranted the production of two new editions, revised, enlarged and brought down to date.

One of these—in response to calls from many who had purchased the original edition—is an *edition de luxe*, printed on specially made Old Stratford deckle edged paper, the full page plates on India tinted paper, with binding of heavy buckram and gilt top. Price, \$5.00.

The other edition is uniform in appearance with the first edition, but contains the additional matter. Price, \$3.50.

This is by far the best book on American duck shooting ever published. It contains figures and descriptions of every swan, goose and duck known to America; full descriptions of all varieties of wildfowl shooting, and a great amount of information on guns, shooting, retrieving, dogs, decoys, blinds, batteries and boats. No duck shooter who wishes success can afford to be without it.

It is illustrated with eight full page plates, fifty-eight portraits of swans, geese and ducks, more than fifty vignettes in the text, and many plans of batteries, boats, etc.

FOREST AND STREAM PUBLISHING COMPANY,
346 Broadway, New York.

HOLIDAY BOOK OFFERS.

In order to extend our range so as to cover a wider field, and to give our readers at a distance and often far from towns an opportunity to purchase without trouble books of a general character, we have made arrangements by which we are able to submit to our subscribers a large number of general books at prices which are extremely attractive, and which will not fail to appeal strongly to the reading public. These books are printed from large type on good paper, and are bound in handsome and durable, if inexpensive, cloth binding.

The first list includes more than 400 titles of standard works, embracing fiction, essays, poetry, history, travel and exploration. Among them are many of the classics of English literature, together with many works translated from the best French and German authors. The boys' stories of Horatio Alger, Jr., James Otis, Harry Prentice, G. A. Henty, and the girls' stories of R. N. Carey, C. M. Young and Fannie E. Newberry offer to boys and girls good and interesting reading for the long winter evenings, which we feel sure they will be glad to have. Especially interesting, because exciting and because true, are the patriotic historical stories, which have to do with the early events of this nation. The series of biographies tell of the lives of many of the most celebrated persons known. But it is in the sets of classics from the pens of such writers as Cooper, Blackmore, Dickens, Dumas, Geo. Eliot, Scott and others that the greatest bargains are to be had.

To all persons about to send in their subscriptions for the year, whether new or renewals, the FOREST AND STREAM offers the following opportunities:

Offer No. 1, on Books, Price, \$1 per volume.

Any 10 volumes, listed at \$1.....\$10	} will be sent on receipt of \$8.	Any 20 volumes, listed at \$1.....\$20	} will be sent for \$12.
Forest and Stream for 1 year..... 4		Forest and Stream for 1 year..... 4	
— \$14		— \$24	
Any 15 volumes, listed at \$1.....\$15	} will be sent for \$10.	Any 25 volumes, listed at \$1.....\$25	} will be sent for \$14.
Forest and Stream for 1 year..... 4		Forest and Stream for 1 year..... 4	
— \$19		— \$29	

These prices include express or mail charges. The volumes will be sent as ordered, post or express paid. All that is necessary for the subscriber to do is to send us with his subscription a list of the books desired, with the money according to any of the above combinations, and the books will go forward to him at once.

HOME LIBRARY, Price, \$1 per vol.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

FOREST AND STREAM CHRISTMAS NUMBER.

THE Christmas Number of FOREST AND STREAM, consisting of fifty-two pages, and handsomely illustrated, is the most notable issue of a sportsman's journal ever published in the country. It is for sale by all newsdealers, or will be sent from this office.

ARTHUR CORBIN GOULD.

We record with profound regret the death of Arthur Corbin Gould at his home in this city on December 15. As the editor of Shooting and Fishing Mr. Gould was widely known and was as widely esteemed. The news of his death has brought to his associates and acquaintances a keen sense of personal loss. His age was 53.

Mr. Gould was for many years engaged in the wholesale wool trade in Boston, and like so many of Boston's business men found his favorite recreation in the woods and on the stream. He was specially interested in the science of projectiles and the art of rifle and pistol shooting, on which topics, by constant study, he came to be recognized as an authority. His taste for these outdoor pursuits and his bent toward journalism prompted him to undertake the publication of The Rifle, a monthly journal devoted to these subjects. The Rifle in time outgrew its limited field and was enlarged into Shooting and Fishing, of broader scope, which Mr. Gould brought to New York.

Mr. Gould had a genuine interest in woods life and the recreations of field and stream, and wrote with felicity of his favorite themes. His kindly nature was reflected in the pages of Shooting and Fishing, and with the passing years he won a constantly widening circle of friends by whom his death has been sincerely mourned.

In another column we print the fitting memorial of Mr. Gould which was adopted by a meeting of his friends and business acquaintances in this city last Saturday.

THE WINTER WHITENING OF ANIMALS.

EVERY hunter and outdoor man of temperate or northern climes knows that at the approach of winter or when the snow covers the ground, there are certain animals that change their color and become white. Why they do this and how they do it is very imperfectly understood. In a general way we know that certain animals inhabiting Arctic regions are always white or nearly so. Thus the polar bear, the white wolf, the Arctic fox, an alpine goat, an owl and a finch are white, or nearly so, at all times, and in the north temperate zone there are many animals, such as weasels, hares, grouse, and others, which change their colors with the seasons. It is obvious enough that these color changes are adaptations to environment, and that they have a protective purpose. We may assume that they are the results of natural selection, carried on over an indefinite period of time. But this is vague and general, and tells us nothing of the origin of the change.

Not very long ago Capt. Barrett Hamilton read before the Royal Irish Academy a paper in which he endeavored to explain the winter whitening of birds and animals living in snowy countries, and these are some of the conclusions which he draws:

It was found that in mammals there is a definite sequence in which the various parts of the bodies whiten, and that this sequence corresponds to the summer accumulation of fat on the outside of the body. Thus on the belly, where the fat is thickest, the hairs are permanently white, and the rump, where also there is a large accumulation of fat, is usually the first part to whiten in winter.

At the close of the summer most animals in northern lands accumulate fat rapidly, and this fat is always distributed in the same manner on the body of each species. The accumulation of this fat indicates deficient oxydization and the slow assimilation of nutrition in the parts

which it underlies, so that the process is one of atrophy. This process reaches its height in the autumn, at which time it may begin to extend to the hairs, the pigment of which is removed so that they become white. The change of color, as already remarked, begins at those points where the layer of fat on the body is thickest and the atrophy therefore greatest. If a change of coat takes place at this time, the new hairs are white. Animals which have once become white remain white until the coat is shed. In very cold countries, where much fat is accumulated as a protection against the cold, animals become white all over.

Attention is called to the fact that many domestic animals highly prized for their power of accumulating fat have a tendency to become white or nearly so, and that in both domestic and in wild animals, the belly, where occurs the principal fat tract, is the part most frequently white, while after this follow the rump, parts of the neck, and limbs and head.

Many of our big-game hunters will recognize among familiar North American mammals a tendency to whiteness in winter. Besides many small mammals, deer and mountain sheep, on assuming their winter coat, are paler than in summer and a gradual whitening takes place well into the winter.

In many cases this atrophy of the hair goes further and assumes the form not of whitening but of baldness. Marine mammals, so frequently hairless, are said to be so in proportion to the development of this fat layer about the body. Fattening cattle are said to lose their hair. On the other hand, baldness in man and the frequent whiteness in the horse's face occur where the skin immediately overlies bone and membrane, and perhaps may thus be illy nourished.

The whole subject is an interesting one which requires further study.

MAINE WILD ANIMALS AT ST. LOUIS.

THE Maine commissioners to the Louisiana Exposition have determined upon a log cabin filled with trophies of the chase as a fitting representation of the State at the Fair. The plan has met with some decided opposition among those who consider that the backwoods interests are not the ones to put forward to the world. State Master Obadiah Gardner, of the Maine State Grange, took occasion to protest in his annual address last week. "Every other interest," he said, "is to be subverted that we may appear at the St. Louis Fair in the garb of aborigines, in keeping with the prevailing opinion in the West that Maine is composed of icebergs and wild animals. With \$123,000,000 invested in manufactures, and as much more in agriculture, it would seem that these interests, with many others, should receive some recognition at the hands of the State in advertising our wealth of resources."

Which may be perfectly true; and it is to be assumed that these varied industries will have their due recognition at St. Louis. On the other hand, Mr. Gardner may well remember that at this stage of the country's development the people of the United States are in growing numbers interested in knowing where they may go for game; and the projected demonstration of Maine's wealth in wild animals is likely to prove a good business stroke.

The State Master also made a strong protest against "the arbitrary and unjust laws for the protection of wild animals against the best interests of Maine," declaring that "so serious have become the conditions in the northern part of the State, as the result of this law, that the growth of population in that section has wholly ceased. The cause of civilization," he added, "is mightier than the cause of the sportsman, and its march must not be retarded to gratify the ambitions of the latter."

That is a sentiment which every sane person would indorse, were there any actual conflict of the interests of "civilization" and of the "sportsman." As, a matter of fact, there is no conflict. The only manifestation of "civilization" with which the sportsman is at war, is the civilization which spells extermination of game animals. The only game laws the sportsman asks are such as will stay the extinction of the game supply. If the code goes beyond reasonable protection and conservation of nature's resources, and works a real deprivation to the community and affects unfavorably the development of the country, it is to that extent unnecessarily stringent and is unreasonable and unwise. If, as the State Master asserts,

the Maine law is of this nature, it should be modified. But are the conditions as represented? Is there any actual conflict of the farming and the sportsmen's interests? Valuable testimony on this point might be taken among that not inconsiderable number of Maine agriculturists who are precious glad to supplement their farming revenues with the ready cash paid to them as sportsmen's guides.

TRESPASS CASES.

THE case of William Rockefeller vs. Oliver Lamora for fishing trespass on the Rockefeller preserve at Brandon in the Adirondacks was re-tried last week before a jury of the vicinage, and Lamora was acquitted. The newspapers report that the case turned on the point whether the Rockefeller waters had been stocked by the State or not. It is explained that private parks which have been stocked by the State are open to the public and may be fished by anyone. This is a mischievous report; there is no truth in the statement, and its repetition will tend to deceive the public and encourage people to fish where they have no legal right to fish, and so get them into trouble. The facts are these: The private parks law provides a special penalty for trespassing to fish or hunt in private parks; but one provision is that this special penalty provision shall not be operative in the case of waters which have been stocked from the State hatcheries. The common trespass law applies, however; the public has no right to invade the preserves, and trespassers may be punished under the trespass law other than the special law referred to. The Lamora case does not establish any right to fish in private waters. An outsider has no more right to trespass on a fishing water to fish for fish supplied by the State than he would have to drive a reaper into a field of grain raised from seed supplied by the Government to one of Speaker Cannon's constituents, or to enter a tenth-story city flat to get at the flowers in a window box grown from seed supplied from Washington by request of Senator Depew. The free fish abuse and the free seed abuse ought both to be suppressed; but neither of them can be remedied by such confiscation of property as would come of opening the streams and the fields to the public.

The finding of the jury in the Rockefeller-Lamora case has a parallel in another fishing trespass case which has just been settled in Delaware county, New York, where Dr. Henry G. Preston, of Brooklyn, has secured by purchase and lease the exclusive fishing right of the Millbrook stream at Margaretville. This water has always been open to the trout fishermen of the neighborhood, and the closing of it has aroused much local opposition. In the case which has just been tried Dr. Preston's agent, Sliter, brought suit against a resident, Frank Krum, for fishing trespass. It was developed by the testimony that Sliter had enticed Krum to commit the trespass, and the jury found for the defendant, as a jury may be depended upon to do in every such case where there is a shadow of ground for their letting off their neighbor.

FOREST RESERVES.

Two forest reserve measures of transcendent importance are now before Congress. The first is the Appalachian Park scheme, which was favorably discussed in the last session; and the second is a new measure introduced by Senator Gallinger, of New Hampshire, for a White Mountain forest reserve. The bill calls for an appropriation of \$5,000,000 to enable the Secretary of Agriculture to obtain lands, estimated at 1,000,000 acres, in the White Mountains. There is special urgency of prompt action in the matter, for under existing conditions the forests of New Hampshire are undergoing ravages which it will take centuries to repair. In the closing number of the season of 1903 the Mount Washington paper, Among the Clouds, known to all White Mountain tourists, spoke from a full knowledge this significant warning:

Nothing else can save the forests on the north slope of the Presidential range from destruction. If the bill does not pass this winter, the most beautiful parts of the range will be disfigured, to remain so for years. Evidence of a public demand for the bill will go far toward securing its speedy report. Let the lovers of our mountains watch the progress of the bill, and press with all their earnestness for its immediate passage, if they would preserve our scenic beauties intact. Let the appeal come from every State, that Congress may know it is not a sectional matter, but one in which the people of the whole country are interested.

The Sportsman Tourist.

Floating Down the Mississippi.

III.—As to a Lying River.

THE first few miles down the Mississippi were as disappointing as my first view of it had been. There was plenty of water in sight—twenty feet above low water mark, I think—but the banks were just willows—a low, level green line of them on one side, and on the other, Missouri, a line of "bluffs"—tree-grown cliffs—with a railroad's gashing along their face. Here and there were dwellings and open lands, but for the most part trees grew and covered what they could of the limestone, which seemed to be disintegrating. The trees were in their autumn foliage, but somehow the sallowness of the yellow river had spread high above even its high water mark, forcing its dull yellow hues or rusty shades upon everything in sight.

It was a dull scene, without striking contrasts, but it was a most engaging one. No single feature arrested the attention for more than a glance of time. It was interesting, but it seemed to me as if I had merely a long journey on a yellow river, lake-like in its dimensions so far as I could see, with the addition of a constant motion forward, which very quickly ceased to be "flowing" in the mind, but became "lurching heavily onward," first against one bank and then the other, but so quietly and softly that it was merely amusing. Had I not been forewarned by the stories of men who knew the river, it would have been easy to become another of the guileless victims of the stream. As it was, I thought the river was "easy."

Enlightenment does not come all at once, nor as a result of true statements in appearances. Likely enough the first awakening from a sense of being equal to the occasion that a man has on the river is a view of tumbling waves far ahead. The water seems fairly to rear up in the air, toss cream froth, and be in every way fearsome to the man in a skiff. On my first day afloat, while the water around me pitched and rolled, away down the river it looked calm and glassy, as if I was in a mere flaw of gale, and had only to get out of it to find gentle zephyrs. The waves were ripples, the calm, mirage. The Mississippi is a corporation liar.

Again on a quiet day when the surface is so smooth that the eye gazing far ahead sees the curve where the water banks up in the bend of the river before it swings off to right or left, like the fragment of a monstrously large and wonderfully shallow saucer, the current carries one closer and closer to banks of earth against which the water is saving, and there is a good view had of soil in layers feet thick, marked by thin lines where weeds grew during a few months and then were covered by another layer in another flood or two. The stillness, the warmth, the softness of the air against which the voyager is borne, quite lull every suspicion, and the one to whom it is all novel would certainly resent the intrusion of a harsh thought. Not even the sifting down of a little rivulet of sandy earth in that bank rouses one, but the thing that jumps his stomach into his throat, sends him clawing for the oars and drives him far from that shore is the pitching forward of ten tons of the earth flat-faced upon the water. A "pop" sound, as if some giant had burst a flour sack on his knee, is heard, a flicker of dust and flying spray is seen, and then the water lifts up and a wave comes forward, sometimes very high, with the bald top showing just a line of frowzy curl.

However sentimental one may become on one of these "pretty" days, it takes a good deal more than mere sentimental force to retain the feeling when the banks are caving a few yards away. A scene that has hitherto seemed serenely peaceful becomes in a breath one of tragedy when a sliding bank settles or a caving one falls. A most impressive spectacle it is when the water of a storm a thousand miles away is cutting into the acres to see a once wealthy farmer watching his plantation go yard by yard day by day, unable to do more than guess at the time of the end, till at last the corner of his home, once a mile inland, sags down—deserted by this time, of course—and nothing is left. It is not the least of the tragic wonders of the Big River.

There is a system to circumvent the lying stream now by which the man on an Illinois bottom—and elsewhere!—may read that heavy rains are falling in Iowa, Wisconsin, Minnesota, and northern Missouri. It may be his corn is planted and growing weather has brought the bottoms to such a state of corn beauty that he is exultant. Perhaps there is a little rain, just enough to keep things growing nicely; the river smiling and way down.

He reads that the Wisconsin River is rising; Des Moines has begun to tear up bridges, and Omaha has experienced the worst rain in the memory of the prophets, and then the state of his mind may be imagined. This year it was reported that "Rain favors Missouri," on May 20, in an item from Columbia. At St. Louis the water was 21 feet, rising—the danger line 30—weather fair and warm. At Chester, Ill., the water stood at 16 feet, danger line 30. On May 29 there were 24.4 feet of water above the low mark at St. Louis and 20 feet at Chester. On the 2d of June the water was within a tenth of an inch of the danger line at St. Louis. At Chester, seventy miles below, the water was still only 23.7 feet—but in the basin above rains were pouring down. Missouri—"The Big Muddy"—was coming, more than bank full. Long before it reached him the farmer in the low land knew what to expect. With his crops doing well, his corn looking fine, the river still low and innocent-appearing, he began to think of how much he would save of it. At Kansas City, Mo., the water was 14 feet above the danger line of 21 feet—this water was coming down on the people of the lower valley. They watched the marks—logs and sticks and sand bars, by which they measured the height of the stream—go under one by one. The water poured into the willow bottoms, filled the chutes and sloughs, came to the edges of the cultivated lands, went coursing over the lowest of these, tinkling forward into the foot prints left by the horses and mules when they hauled the

planter, and in mimic flood rushed along the wheel ruts—if it rose an inch an hour it was coming fast. And so it was long drawn agony. It was not possible to keep the water out of those hoof prints and wheel ruts, small as they were and slow as the water came. There was time to take the cattle to the Missouri hills, and the family to tents on the bluffs.

And then came long lists of disasters—bridges down, houses floating away, laggards drowned, still miles away, but upstream, and each day closer by forty miles. St. Louis reported 39 feet and Chester went to 33 feet a couple of days later. And then the Illinois bottoms were drowned out—the flood was upon the farmer, even though the sun had not been clouded under.

It is a good system by which the heights of water hundreds of miles down stream is foretold from the gauge readings at St. Paul, Kansas City and other up-river towns, but to my mind there could be no more nerve-racking one than this of foretelling the danger with relentless, scientific accuracy, as done by the U. S. Weather Bureau. It is even worse than visions of fire, for it is foretelling clammy and snake-like.

The evidences of the floods in low water are hidden from the newcomer's eyes by his ignorance of the signs they leave. It is the dark yellow line on the sides of houses half a mile from the river, indicating the high water mark that comes to his notice first of all, probably, and causes the natural question of "What made that?" Away off yonder, somewhere, is the river, beyond woods and fields, unheard, unseen and unthought of, yet here is its mark, a foot higher than one can reach.

On the first night out Jimmie and I ran a hundred yards up an unknown—to us—stream, and tied to a willow tree a couple inches in diameter and began to chuck the duffle around making a camp on the boat, putting up the square of canvas A-tent fashion, and that sort of thing, but we quickly dropped down into the wind at the mouth of the creek, for mosquitoes were out a plenty, and to spare. We spooned together in the stern that night, and slept considerable of the time. Morning came, and with it a dismal rain which lasted several hours, and that was the bluest day I had experienced in a long time. I was glad that the current was there to carry me onward in spite of my feelings. It was gloomiest of all when, after the sun came out, Jimmie had to go back to St. Louis and I pulled out on the river, very much alone, except the wild geese and ducks, the swirling waters and insides that worked up into the back of my mouth, but dismal and lonesome as it makes me, I don't want to get over the feeling of homesickness.

I wrote in my diary four or five miles below Riverside—where Jimmie was to take the cars, but got carried three miles past it, we not knowing the town when we saw it—"On the right bank (Missouri) are high bluffs, limestone cliffs full of holes where the water has ground out moon- and round- and sugar-loaf-shaped cavities, and here"—a ways further down—"is a wilderness, the trees just turning on the right, and on the left are caving banks, covered with second growth poplar twenty feet high, but now pitching into the river, the green heads of the fallen washing in the water, and one just whirling out from the lower end of the bank with the send of the current. The wearing away of the bank is done through the tangled fallen, root-washed trees. Blue is the sky, blue (reflection) the water, dim the bluish sun, blue the distant shores, and lonely the lad afloat."

At intervals all along were "Government works"—dikes of piles and rip-rap, or broken stone facing of embankments. To the mere river traveler the dikes were fearsome things to look upon, for they consist of rows of piling, the piles being driven in bunches of four, in holes sucked out and pumped out to the required depth, anywhere from fifteen to sixty feet or so, and then the poles are bound together with wire rope, each bunch separate. The bunches reach out into the river in long sloping lines of black, for scores of yards, serving two purposes, one to protect the bank below, the other to send the water into the ship channel. On occasion it is used to wear away the opposite bank—which purpose it always serves, willy nilly, if the bank is silt, unless rip-rap is used to protect the place where the deflected current strikes the far shore.

A most unpleasant thing to look upon are these rows of black headed piling. A dim flickering line in the distance, a closer view shows a loose pile here and there, flinging back and forth, a bending, pounding arm, slashing the water with a loud evil sound, and thumping its fellows on occasion with hollow booming. All along these dikes the water pours through with a loud noise, increased by the drift caught along them, while the current at the outside end leaves the obstruction in whirling coils.

There are thirty-five pile drivers on the river, and they are put to all sorts of tasks on occasion. At Little Rock Landing I found one furnishing steam to drill blasting out of the rip-rap, and one may find them making pin-cushions of all kinds of river bed. If he goes down behind some of the islands he is likely enough to find dikes already there, with rod high piles of drift against them impassable to anything but tooth picks and the water. These dikes serve the purpose of making mud deposits behind them and so filling in the sloughs, and thus deepening the river channel by confining all the water to it. In this work of running the river into one channel, the benefit to navigation is obvious, and also to farmers likely to be inundated or completely washed away by a change in the course of the main current from one side of an island to another.

One is not long afloat before he watches the water eddy in around his boat, boiling up from the bottom, or going down in little swirls or sucks, according to the lay of the bottom. To watch this apparently thick mass is sure to suggest that an enormous quantity of material is conveyed down the river every year into the Gulf of Mexico. And the fact that behind the dikes, wrecks, snags, and other river obstructions the silt gathers in masses many feet deep in the course of a single flood, confirms the suspicion. The river sharps have studied the matter with care, and they tell some things in long lines of figures that are intensely interesting to those who care to view the river even from the deck of record mak-

ing steamboats. The figures are most meaning ones to the man who floats in steamers, for the pilot of the craft has constantly to remember that such and such a bar is making, and such another one is walking diagonally across the stream to some point some miles below. Nothing in the whole river is the same from day to day. In some places the change is imperceptible, but the simple fact that more than half the lights of the Government marking the channel of the river had to be shifted from half to a mile and a half after the flood last spring indicates something of the moving nature of the stream and its bed. A river in which a sand bar a mile long moves a mile down stream in one flood has carrying power which even a woodsman with an acquaintance with snow drifts can understand, but the scientists say that it takes 6,000 years for the Mississippi to lower its drainage surface one foot. Great as is the river, it is not too large for the laser that it drains, and compared to which its mud and shifting sands and acres of drift are but stray specks and pulp fibres.

But to the human mind these specks are quite sizable. The figures are small to start with: "The average ratio of dry sedimentary matter (from water secured one part each at Randolph and Carthage and two at New Orleans) to the weight of water and sediment equals near 1-1245." By another method, water being poured into a long tube from the river and allowed to settle, a mass of water with an aggregate height of 1,936 feet deposited a solid column of 46½ inches, the water covering two years of the river flow. This gives a mean proportionate quantity of 1 to 528. In the main current, whether near the surface or near the bottom, no difference could be detected in the quantity of sediment carried; the sand and gravel—the bottom flood—were not considered in these figures.

The sediment carried into the Gulf yearly would make a pile a mile square and from 263 to 268 feet high—more now that the levees do not permit the water to spread out on the bottoms and deposit layers of soil on them, and this amount will gradually increase as the levees are brought to completion, and the river is kept from stopping on the way to the Gulf. If the water moves at a certain speed, there will be erosion, and not depositing. Part of the work on the river—the major part—has been to use this simple fact that the sediment will not settle if the water is kept moving fast enough, and it will if it is checked, hence retarding dikes and deflecting dikes.

As I floated with the current and looked at that simple line of bluffs, the wide, scarcely ruffled waters, and the willow banks, it was for a long time difficult to associate the figures in my note books with these three elements. The mind was confused, as the eyes are when one comes out of the light into darkness, and even now, after nearly three weeks of close association with mud banks, wind-drifted sand, islands, chutes, sloughs, and river people, there is much of that same confusion. Old Jack Stevenson, with whom I traveled from Kaskaskia to Tiptonville, where I am now, time and again picked up sticks saying, "Here's a piece of batten," or "that come out of somebody's house," or "I guess this is part of an old cupboard." That scattered drift, sawed and natural, was one mass of details, many of which I ought to have been able to see, and yet I could not. And in the petty things like making camp and preparing meals I was at constant loss in my efforts to think what next to do.

Some odds and ends from my diary will show just as well as anything of what a close association with the river will do to one at first. I give them as written:

"In midstream, rafts of ducks, a dull, blue day; still those great limestone hills, with hollows through which the wind comes when opposite—in the far distance a row-boat. On the Missouri side the hills, on the other the flats, with landing sheds. Ducks in great flocks look like serpents when flying; islands when afloat. Tennessee and Ohio River not a circumstance—what must it be below? Beautiful, beautiful! Even the Government dikes show the size of the stream, movable teeth that they are, sawing and slashing back and forth in the wind."

Where my eyes and thoughts were when I wrote of ten inch piling tossed by the "wind" is problematical. Sitting with eyes three feet above the surface of the wide water, it is not an uncommon optical delusion to see a broad strip of "sky" in the distance between an island and the water—a mirage effect—so with the mind brought close to the "Father of the Waters," it notices things, but in somewhat twisted aspects.

A caving bank led to this: "Solid (sic) banks of silt with layers of vegetation—mere thin lines—between one, two, three feet layers to show that there (at the lines) floods rested, and turned back, and above a new flood laid a new layer—and now another flood takes all that the others deposited for purposes of its own further down the river. Governed by rigid laws, yet the river seems to be at play—here building, there tearing down, nowhere giving man peace."

Large islands have been entirely washed away well within the memory of men, and others are in the process of building, but of late years the vigilance of the "Government Workers" has begun to regulate these changes more or less in conformity with the ideas of the river people. The man who sees his plantation eaten away by the thrust of a dike put in four miles or so above him in order to give steamers a better chance, is likely to be biased as to the work done, and so is he whose boat goes round a long bend where a short cut off would shorten the way many miles, when strong efforts to save the caving peninsula are made, as at Cairo.

This much has been accomplished by the commission in regard to the caving bank. It was able to say in this year's report (for fiscal year):

"We have reached a stage in the development of bank protection work where we can confidently undertake to prevent further bank recession at places where the interests involved will justify the expense."

It's a bit tough on one to read a sentence like that, for if it has taken the Mississippi River Commission twenty-five years to reach a point where it could confidently say it had learned how to do one of the things it has set out to do with the river—this is not all the commission has learned, of course—how long would it take a man to learn everything about the river? But it is easier to learn the Mississippi and what it will do than to make it do anything.

RAYMOND S. SPEARS.

Winter Echoes of the Summer Camp

LET me say at once I have never camped out in my life. I can tell you nothing of tents, nor of cutting brush; I have no knowledge of insect pests nor of how to exterminate or endure them; no opinions of the proper or improper way to build a fire, to make the bed, to air the bedding, to divide the work; or of anything else that goes to the making of the camp itself. Yet I know something of camping from actual experience. I have started out so many parties, and have put away their impedimenta when they returned so many times that a good deal of information has rubbed off. I know, of course, only of the beginning and of the end; of the start and of the return. But if half the yarns be true that my fisherman tells me of the strange preparations men sometimes make, and of the articles they conceive to be appropriate for such occasions, a word or two of advice from so experienced a person as I can hardly come amiss.

This question of impedimenta, by the way, becomes a serious one after twenty or thirty years of accumulation. Some years ago my fisherman started to build a barn on the end of the lot. He planned it with care, and was ingenious in discovering uses to which it could be put. This was natural, for we had neither horse nor cow, goat nor pig, wagon nor sleigh, to render it necessary. One day, however, in response to a rigid cross-examination, he revealed the truth as to why he was building this apparently unnecessary addition to the place. He had to have a place in which to store his fishing rods!

In spite of this, however, there have been times when the fishing in the river near home was very good, and one trip trod hard upon the heels of the preceding one; when bait cans, buckets of minnows, black-jacks and catfish, nets large and small, fishing-rods, gum boots and wading shoes so filled the front yard that visitors had hard work making their way to the house. At the same time the back yard hung full night and day with old clothes drying for the next trip. I always feel on these periodic outbreaks that the only thing that has kept us from the attention of the authorities is the fact that it must be years since anyone in the village has expected us to be sane on this subject.

Other fishermen's wives have a similar tale to tell. A kinsman one time married a wife, and when the dray came to the door bringing the belongings of the head of the new household, there were in it, of course, some furniture, clothing, books, and other so-called necessary articles, but these were entirely concealed by his more valuable possessions—fishing rods, baskets, gum boots, and tackle of all kinds, so that apparently the load consisted entirely of them.

In his hay mow, so called, for it never had a wisp of hay, the campers keep their outfit, which has been gathering for years: a large tent, a small tent; a box of cooking utensils, coffee pots, tin plates, dishes, etc., of all kinds and conditions; hampers and baskets in various stages of decay; gum boots and fishing-rods, and a variety of other things that I avoid looking at or touching, they seem so unpromising.

The camping parties that start from my fisherman's hay mow usually go about the last of June. When the fateful day draws near, all the stuff is overhauled many times by the various members of the party, and long lists are made of articles that will be needed. One camp that I have heard of tried provisioning by having each member bring what he thought best. When they took account of stock they found that one man had brought only a bunch of onions that he had gathered while escaping through the barn; another a crock of scrapple; still another a head of cabbage and an apple pie, and that they were nearly as badly off for food as was the historic camp with four gallons of whisky and a loaf of bread. The provisions are an important part of the trip, and the parties that I know about take pains to provide them carefully.

This method of getting ready really adds considerably to the pleasures of the trip. In fact, the camping begins the minute the campers take the first step up the ladder into the hay mow to see what they will need. From that minute they are no longer lawyers, doctors, teachers, parsons; they are all at one or another stage back toward the primitive man. I even notice a change in their attire—a more rakish air; first a handkerchief tied around the neck replaces the collar; then a slouch hat, a belt, a flannel shirt, until by the day they start they all with one accord attire themselves in as near the outfit of a wild woodsman as their resources and imaginations permit.

Then comes the packing up. The parties that start from our haymow always pack up the day before. They pack all day, and almost all night. They usually begin with the bread and only realize their mistake when all of the heaviest articles are discovered waiting their turn. Then the packing starts over again. They are no fonder of advice than ordinary men, and it is only when it waxes on toward midnight, and the box has been unpacked at least once by each member of the party, that it is received with even ordinary civility.

In spite of this arduous day's work, they usually insist on starting very early in the night, even earlier than ordinary fishing excursions, being satisfied, as a rule, with not later than three or four o'clock. They usually forget something—the bag of potatoes, the crock of butter, the hammock, or the lantern, for which they must return or be greatly inconvenienced.

Various echoes from the camp reach me. Frequently I am consulted about the cooking, and am asked to furnish recipes. One year my fisherman aspired to flannel cakes. There was no reason, he said, why they should not add this dainty to their fare, especially since it was so easily made. He wrote out the directions—flour, eggs, milk, soda—carefully. The sequel I heard later.

Toward the end of the week, when the campers were a little tired of the fishing and probably of each other, they decided that the time had come for the flannel cakes. It was about three o'clock in the afternoon, and they started at once to get them ready. One man went for milk to the farmhouse on the hill, and while waiting, my fisherman measured out the flour into an eight-quart bucket. Instead of the two quarts called for in the recipe, he took four, to be sure to have enough. As they did not have eight eggs he took five, and—think of this, ye cooks!—broke them right into the flour, and proceeded

to stir the mixture until the milk arrived. He then added the milk and other ingredients and kept a man stirring all the rest of the day to get out the lumps, which, it is unnecessary to add, could not have been stirred out in an eternity. They tell me there was a man on the road coming or going for milk for two hours, and that when they finally desisted from beating the mixture, there was as much of the batter on the outside of the bucket and on the gallant cooks themselves as in the bucket. Then they baked the batter in an iron pan and had supper, and were thankful to find themselves alive the next morning. Verily, cooks are born not made.

At another time a kinsman aspired to make an omelet, another very simple thing. He took his directions from Mrs. Rorer, learned them by heart, and kept repeating them over and over. "Give seven beats of the fork." They tell me he said it at last in his sleep. The opinion, however, was unanimous that he must have given eight beats or spoiled it some other way, but all agreed nobody had been in any danger of dying from the effects, for nobody had been able to eat it. They had better success with Saratoga potatoes, and, I judge, learned to cook several things pretty well—trout, coffee, ham, potatoes, eggs. Many times, during the long winter, when the blissful summer days seem very far off, they pine for a cup of the coffee they made while camping.

Stories of other things come to my ears. They tell me of the beautiful spot where they always make their camp; the grove of maple trees with the big creek on one side and the little creek on the other, and the grand old mountain across the stream; of the way it all looks by moonlight and in the sunrise. They try to arouse my fears by tales of rattlesnakes and bears. They all claim to do all the work; and make assertions as to how lazy the others are; how careless with their dress they get; how much they eat and sleep, and smoke. They tell me of the daily happenings: how someone sometimes steals their fish or eats up all the ginger cakes. They relate gleefully how afraid the others are when hard storms come or a miniature flood drives them to seek higher quarters; if a strange animal prowls about the camp or if a snake is found. In fact, the character of hero changes with the narrator, quite as in life.

They discuss various subjects. Sometimes the number of campers is too small, and they disagree; sometimes too large and they have not room to sleep comfortably. One night, when nothing better presented itself, and somebody was in a contrary mood, the whole camp argued until nearly morning whether the sun sits or sets in the evening; and whether a hen sits or sets on her nest. Sometimes politics and other of the cares and anxieties of life creep in and threaten the peace. Sometimes one of the campers has a new girl whom he cannot forget, or sickness at home tugs at the heartstrings. But usually, I doubt not, they are happy, care free days that refresh the wearied souls of the men and send them back to their work with new ties, new ideas, and, best of all, with new stories to tell.

During these many years I have thoroughly enjoyed these camping parties. Were all the pleasant gossip concerning them around my fireside cut out, I, no less than my fisherman, would miss it sadly. I sometimes wonder if any part of the success of an outing that a woman has started out and welcomed home properly belongs to her. Whether the certainty of sympathy does really add a zest to the trip? If the bit of adventure is ever a little more interesting because of the audience to whom it will be related? Whether it does not form a little closer tie than that of mere friendship? Indeed, I am sometimes prepared to answer these questions myself, and to assert that by her sympathy, her encouragement, and her aid, many excursions are made much more pleasant than they would be but for the woman who stays behind.

JUSTINA JOHNSON.

The "Upper Missouri" of To-Day.

APPEKUNNY's serial story entitled "Floating Down the Missouri," which appeared in *FOREST AND STREAM* during the years 1901-2, filled the minds of the Doctor and the Colonel with an intense longing to instantly follow the footsteps, or rather, the paddle dips, of the author and his Blackfoot wife; but O tempora! O mores! were loath to consent. The confederates were bull-headed, however, as well as self-indulgent, and so they conspired, contrived and persevered until the opposing waves rolled back and the way opened for them in this autumn of 1903. Appekunny himself had promised guidance; but alas! alas! his services were withheld at a late hour, and so Tommy, whose origin was in the Maine woods, came into requisition—a canoe builder, cook, hunter and everything-else-you-can-think-of all combined, is Tommy—and he was despatched to the rendezvous with instructions to build a boat, equip it with provisions, utensils and if necessary, also a crew, for, the absence of a guide must not be permitted to circumvent the seemingly long anticipated voyage. Upon the receipt of a telegram announcing the consummation of Tommy's mission, the Doctor and Colonel dropped the tools of their trade and forthwith set out for Fort Benton (Montana), the long-time accepted head of navigation of the Missouri River, and three days later viewed with complacency, from the river's bank, a little fleet of three boats which constituted their command. There were three boats, because a small skiff is an indispensable adjunct to a house-boat and besides, the two men whom Tommy had corralled owned a large skiff, which must, of necessity, accompany them, because they were bound down the river trapping and had to have with them, of course, their traps, their stores for the coming winter and, worse luck, two dogs for society. These two men were Jim, a professional trapper, late from the Cascade Mountains, who had spent a successful winter along the Missouri in 1900-1901, and was about to try it again as a panacea for his slender resources, and Joe, who, after bivouacking for three years with a cavalry regiment in South Africa, had found the British Isles too conventional and too narrow to suit his new formed ideas as to the fitness of things.

They had entered into a co-partnership with designs upon fur-bearing and bounty-yielding animals of the romantic country drained by the river from which, just

99 years previous, Lewis and Clark had viewed with amazement, the swarming beasts, birds and fishes that inhabited this, then newly acquired, territory of the United States.

After an inspection by the Doctor and Colonel of the remains of the old fort, still standing near the water's edge, which in 1846, and 20 years thereafter, was the most westernmost and one of the best known of the American Fur Company's trading posts, and inhaling a little of the atmosphere of its stirring past, the craft was boarded in the late afternoon and pushed into the current in the presence of a representation of the citizens of the town.

The boat of Tommy's creation was 26 feet long, 8 feet wide and 2 feet deep, carried a sail of liberal dimensions, was supplied also with a pair of oars, as an additional means of propulsion, had two bunks amidship, under a canvas roof, and one across the stern. When laden with bunks, photographic paraphernalia, stove, provisions, etc., she drew but 5 inches of water, while the men's skiff, 12 ft. by 4, carrying some 1,500 pounds of cargo, had a greater draft by several inches, and this fact was subsequently frequently made impressive. The wind was fair, all sail was spread and the voyage began; but very soon thereafter rapid water was encountered, which thus promptly drilled everybody in the simultaneous handling of three boats and two dogs, when each and every one of them evinced a decided inclination to exercise an uncompromising individuality. All hands were pressed with exacting duties for a little while, when, besides being buffeted by wind and waves, the heavy rear boat threatened to crush the skiff, and the dog passengers of the former jumped overboard. The difficulties were overcome without harm, and after an hour's travel camp was established for the night a few miles below the town.

Jim entertained the party with a camp-fire story of what would be seen further down stream. Sand bars would appear to move, because of the many prairie chickens and sage hens upon them; ducks would be innumerable; fish of huge proportions were in schools; deer would gaze askance from every copse—the white tails on one side of the river and black tails on the other—while the wraith-like mountain sheep would stand upon the heights along the river's course in picturesque poses. Jim, like Appekunny, told of conditions as he knew them several years ago, and in several years—but let us not anticipate.

The boat had sufficient deck room, forward of the bunks, to admit of cooking and serving meals, even though the oars were in use; therefore, on each day of travel the first duty was to push into the current and, subsequently, breakfast was prepared without haste or confusion. Some ducks were sighted soon after getting under way the next morning, and they, being duly sampled, proved to be members of the teal family. Before noon, as landing was made on Brulé Bottom for the purpose of visiting the site of Fort McKenzie, which stood here in the heart of the Blackfoot country, between the years 1832-1843, in which latter year it was abandoned, because of Indian hostility and immediately burned by the redskins. The probability that some animated scenes had taken place in this bottom was attested by a number of mounds of the suggestive dimensions, 7 feet by 2. The boundaries of the fort were readily discerned, and beads, clay pipes, hand-made nails and bullets were found midst charred timber and crumbling stones. The river's outlines become bluffs hereabouts, and rise sheer from the water's edge to a height of 100 feet. They display an interesting variety of strata in many colors, and in them some petrifications were found, one of which—that of a so-called snake, a baculite—possessed prismatic hues like to mother of pearl. Twenty miles having been overcome by 6:30 P. M., notwithstanding the loitering on the way, and the deterrent head winds of the afternoon, when the Colonel and Tommy had donned waders and towed the flotilla around a bend, the day was declared at an end. The lapping of water against the prow, the lay of a coyote among the hills and a brilliant moon were delightful concomitants of sleep.

The water and air, at 5 o'clock of the following morning, must have given the two voyagers a cool reception, judging by their haste to find covering; but the appearance of ducks soon afforded them an opportunity to stir their blood by manning the skiff and giving chase. They returned with a dozen blue and green-winged teal, mostly young and tender. Ranches were passed from time to time during the day, whenever a bottom would admit of one, and the interested cowboys were most polite in their greetings and complimentary to the "outfit," as they termed it. One and all anticipated floating down to St. Louis next year, and probably they were more observant of river craft than usual.

This forceful evidence of people, however agreeable they made themselves, was deplorable to the Doctor and Colonel, who hungered and thirsted for the solidities which were associated in their thoughts with this upper Missouri. In the afternoon the bluffs heightened to 200 or more feet, and a variation in the coloring of them often brought striking contrasts into close juxtaposition. At times a dark-colored headland would be ensconced between two of marble whiteness, or vice versa, all of them towering high above the river in fantastic outlines. In one instance a city walled by marble was so closely resembled that it was difficult to recognize in the formation a mere freak of nature. This evening's camp-fire was built under the beetling brows of a bluff to which were cemented hundreds of bird's nests, and from the crevices above these hawks were frequently seen to dart after their prey. A fresh deer track, the first sign of big game, was noticed near the place of landing. Halts had been made during the day for purposes of photography, but, nevertheless, owing to the aid of the sail, 33 miles were accomplished.

Jim set his lines in the evening for some of the huge catfish he had frequently described, and when it came up with bait intact, Tommy and Joe, who had previously displayed considerable incredulity, made facetious remarks.

On the succeeding day, the third from Fort Benton, the bordering acclivities increased their height to 300 feet on either side of the river, which was about 50 yards wider just here, and the combined effect of

height, color and outline constituted what one of the early voyagers termed "visionary enchantment." Photography was one of the objects of the expedition; in fact, the primary one, and throughout the journey of 31 miles on this day, the scenery was all absorbing. Fortifications, parapets, castles (modern and in decay), cathedrals, etc., of white sandstone atop of brown hills, came and went in such rapid succession as to be bewildering, and after photographing any one of these objects, a later view would usually seem the more desirable. To look forward or backward was equally impressive and still, each bend in the river brought newer beauty before the gaze of the astonished beholders; but sad to relate, even here, where any evidence of man, other than an Indian, would be incongruous, the abhorrent wire fences would, from time to time, appear at the edge of a precipice. Only a few scattered ducks were seen in this vicinity, and they received but scant notice, owing to preoccupation with the scenery. A goose, being an unusual sight, attracted attention as it came honking up stream, and it was covered by a double barreled gun in the hands of the Doctor, when some one called out, "Hold your fire!" A man was seen pulling out from shore, evidently in pursuit of the errant bird, which proved to be "Charley," a pet. Joe, whose foraging expeditions among Boer farms had dulled his conscience to insensibility, begged for the critter dead or alive, and was bent upon trailing a baited hook behind the boat with the hope of towing it out of sight of the owner around the next point of land. A stop was made hereabouts to admit of a visit to the long-time deserted hut of a "wood-hawk." The scattered horns of buffalo and deer indicated that he had lived well if not long, midst these Indian hunting grounds and beautiful hills, while wielding his ax in aid of early steamboat navigation and advancing civilization. The wind shifted to dead ahead toward evening, and to avoid a struggle with this element, the boats were beached in what proved to be quick-sands of a treacherous and hungry nature, for they nearly swallowed the Colonel's waders when he jumped ashore with the hawser.

Joe! 'twas cold during the night and also the next morning, when, just before reaching the ferry at Judith, the first flock of sage hens was sighted. They offered a casus belli and an acceptance of it resulted in a more comfortable temperature of the body, and the persuasion of several of the birds to come aboard the boat. Judith, named after the now dry river course which meets the Missouri here, was chosen as a site for Fort Chardon by the fur hunters, who fled precipitately from Fort McKenzie, and the history of the place is interesting. It is now made up of several corrals, to hold cattle pending the crossing of the river, a store and two log huts. Within the store was seen an immense pile of polished buffalo horns which were intended for shipment to the coming fair, where, the indications are, there will be a never-to-be-repeated aggregation of Western people and relics of their past.

Several cowboys, in typical attire, and with the bowed legs that would seem to result from constant pressure upon the sides of their mounts, had met here while traversing the plains in various directions, and displayed the customary interest in river navigation. Head winds necessitated the use of oars during the balance of the day, and progress was only a little faster than the current, which flows about three miles an hour. From a cottonwood grove further down the river two other cowboys saluted the fleet, and the Doctor and Colonel were rowed ashore to assist the civil herdsmen in resisting any bad effects of the bleak wind. They presented a formidable appearance with knives, revolvers, rifles and ropes, hanging from belts and saddles.

An unsuccessful deer hunt had ended, and they were bound for home, where the Doctor and Colonel called later in the day. Home consisted of a log hut situated on a narrow river bottom that was completely hemmed in on three sides by bare hills of 300 feet in height. The cattle range was back of these, on the plains, to which a slender, winding trail up the steep bluff marked the way. The courage of these heedless youths in thus "setting up" for themselves amid the melancholy surroundings, was altogether congenial with this breeding ground of love of adventure and heroism.

These boys were newcomers, and reported that many other settlers had "come in" during the last two years; so many, that every piece of bottom land of any promise was now taken up. This was sad news for those who still had hope of seeing some undisturbed and virgin country.

At about 5 P. M. the boats were tied up, and scouts went back into the hills to look for signs indicative of the nature of the quadruped inhabitants thereof. Tracks of timber wolves, black tail deer, a lone elk, or possibly a confounded calf, and rabbits were noticed. The Colonel's attention was attracted and his curiosity aroused by a loud caterwauling from the overhead cliffs, which he scanned in vain for the origin. Before he could locate the source of the noise and the reason thereof, a large bobcat was seen to flee in one direction and a swift fox in the other. They were each colored by nature to blend with the prevailing hues of the soil, and in consequence their acrimonious debate was not witnessed.

The day following brought trouble in the guise of a howling northeast storm, which, in the morning, blew the boat upon a concealed rock, and, a little later, the men's boat upon a bar. Waders came into prominence, and pushing, pulling and prying were indulged in ad libitum. The scenery continued remarkably fine, and in spite of a cold rain, the constantly changing formations were watched with unflagging interest; but the gray day and lowering clouds unfortunately prohibited photographs.

The hills now subsided and drew further away from the shore, and the more frequent bottoms all displayed signs of habitation. In this vicinity cattle winter exceedingly well and the land bordering upon the river is exceptionally desirable, for this reason that the stretch of plains immediately behind it will probably never be claimed, owing to lack of water right, and consequently the claimant of bottom land gets the free use of a large contiguous grazing country. The

appreciation of this state of affairs has led to the influx of settlers.

On landing for the evening camp-fire, after having floated 30 miles during the day, many fresh deer tracks were seen on the sandy beach; but none of the animals came within range of vision. From the hills just back of the landing place, the Little Rockies, white with snow, were seen looming up on the southern horizon, illuminated by the afterglow as though by electricity, and when darkness enveloped the landscape, midst impressive quiet, they still caught the paling light and seemed a supernatural beacon.

Ice formed on the boat's deck during the night (Sept. 14), and, in the morning, bathing required some heroism. At Rocky Point, the second ferry seen in 150 miles of travel, an old trading post, is in an excellent state of preservation, with its ancient stove, sporting rifles, buffalo heads, etc., still in position. The tenancy of the present occupant dates back 25 years, and he, a connecting link with the past, recounted his recollections of and experiences with people and game of former days to an attentive audience.

Good hunting was said to begin at this place, and since no red meat had yet come aboard and nothing more than an occasional duck had varied the bill of fare for some days, and, furthermore, because progress was being so constantly combatted by head winds that only 20 miles had been recorded, the shore was sought at 4 o'clock. The Doctor had suffered the mortification, a day or so before, of bartering with a progressive rancher for some eggs (a rare morsel in this vicinity), and he now teased Jim by saying, "owing to our having progressed beyond the egg belt, either we must waylay a beef or starve, and since the taking of beef in this country is usually attended by an uncomfortable style of mortality, it seems to me we must choose between two evils of a grave character." After effecting a landing, the Doctor searched the willow-covered bottom for white tails, while the Colonel and Jim visited the bluffs across the river in quest of the black-tailed variety of deer. They, the last named, paddled back to camp after dark without having seen any fresh signs, excepting of cattle. The Colonel remarked that, "to sit in concealment awaiting the appearance of a wild animal and have a cussed bovine sneak up behind and give you a barnyard salutation, is mortifying and damaging to a fellow's self-respect." The Doctor was already in camp and, smarting under the influence of disappointment and angered by the sight of a man in the bushes, was prepared to convince poor old Jim that he was a liar. Finally Tommy arrived with a decapitated rabbit, and was received with acclamation and hailed as the deliverer from a dire famine.

LIPPINCOTT.

BALTIMORE, Md., Nov. 30.

Back-Trailing Horses.

Editor *Forest and Stream*:

Mr. Emerson Carney, and the editor, also, had something to say in the current number, December 12, about trailing horses. I have had horses which were good trailers, and again have known horses which were intelligent enough in other respects which could not, or at least would not, find their way home after night when within a mile of it, unless they had a plain road to follow to get there.

When it comes to finding his way, day or night, I believe the mule has more instinct, or whatever it is that enables him to do it, than most horses have, and if it is water that is wanted, and there is any in the country to be found, a mule will find it sooner than a horse will. I have had them lead me to water where I least expected to find it. The mule could find it, though how he did it I don't know. I rode a small sorrel mare mule many hundreds of miles, at one time or another; she was a pack mule, but was never packed. We kept her for the saddle, and of the many animals I have ridden she was by all odds the easiest one to ride, and was fast enough to run buffalo with. I have shot many of them off her back.

That mule could not be lost, no matter how dark the night was, or how wet or stormy it was, or whether she had ever been in that country before or not. If I wanted to find camp all I had to do was to let her reins slack, then tell her to go home. She would find her way and go straight there, whether the camp was one mile away or ten; and in going to it she went as the crow flies, straight ahead, over hills that I would take her around in the day time, and across a creek or river if she had to swim it.

We made a pet of her; she went under the name of the Pet Mule, and I made a practice of feeding her on bread and sugar. She could not be kept with the other mules unless she was tied, but could always be found among the horses.

On the march she would never stay with the pack train; all the men in it could not hold her; she traveled close up in rear of the column, and if the last file happened to be a single one, she completed it.

We followed a party of Indians that we had found down the country stealing cattle, all one night on foot in single file, leading our horses; it was too dark to follow the trail mounted, and just before daylight we mounted and formed in line to charge through a wet bottom; as I took my place on the left of the line the mule, which had just got away from the pack train, took her place on my left, and kept it while we charged across the bottom, killing one Indian; then when we had halted the captain rode down the line to see if any of us had been killed, and wanted to know what that mule was doing here. I had to tell him that she was also charging Indians.

I do not think that the scent has anything to do with a horse or mule finding camp. I have had a horse carry me right into camp with a high wind blowing right over him from behind him. If there was any scent that wind would have carried it away from him. A horse can see objects in the dark that a man cannot see, but if he has not seen them before they cannot help him any.

I was given an object lesson of a rather dumb mule finding his way to camp when I was out with Indians hunting. This was not an old pack mule, but a team mule that had been given me at my request. I was sent out here by myself. The chief and I had been out all day

"looking at the country," and late in the afternoon we shot two buffalo, and as it was at least ten miles to camp from here, we only took their hides, each of us carrying one; then I took the tongues and as much of the tenderloins as I thought the mule could carry and not be hurt by it.

Some time after dark we stopped to water down in a ravine, and the chief put in some time now fixing his saddle; he rode one of his Buffalo ponies—they are generally more intelligent than the common ones are—but this one had to give the palm to my mule.

The wind had been blowing from the east all day, and at dark our camp lay directly east of us.

When we came up out of the ravine, the chief kept on with the wind straight in his face. My mule stopped and began pulling to the right; I tried to get him to follow the pony, even spurring him, but he would not move.

I had ridden mules often enough to know that one of them can find his camp about as soon as I or an Indian can, and this one was anxious to go to his camp now. This wind has changed, I thought, but it don't fool the mule if it does fool the chief, and calling the chief back I persuaded him to let the mule find this camp for us. He found it. Giving the mule his head now he climbed a small hill, then going straight across a bottom for half a mile or more brought us to the creek that we had our camp on, but the camp was below this a mile if we followed the creek; this mule was following his nose now, though, and crossing here he climbed another small hill, then crossed the next bottom and walked right into our pony herd at the far side of it.

It was so dark now that I could not see a pony five feet away, but the mule had seen them further than that.

He wanted to stop here now, but I started him again, and he next led us into camp, a quarter of a mile away. The chief did not know even now where it was until the mule led him into it. This chief, as much as he knew about this country had got completely turned around to-night.

CABIA BLANCO.

Arthur Corbin Gould.

A MEETING of members of the sporting goods trade and of the press was held at the office of the Winchester Repeating Arms Company, in this city, on Saturday of last week, to give expression to the general regret felt at the death of Mr. Gould. There were present Messrs. Sanford and Irby Bennett, representing the Winchester Company, A. C. Barrell of the Union Metallic Cartridge Company, Edward Taylor of the Laflin & Rand Powder Company, Arthur Hyndman of E. I. DuPont de Nemours & Co., Edward Banks of the American "E. C." and "Schultze" Gunpowder Company, A. H. Funke, Ezra H. Fitch of Abercrombie & Fitch, T. W. Stake of Schoverling, Daly & Gales; Gus Greiff of Von Lengerke & Detmold, W. R. Hobart of the American Field, Marshall Herrington of Shooting and Fishing, and C. B. Reynolds of the FOREST AND STREAM. The Peters Cartridge Company, Messrs. Parker Bros., the Ideal Manufacturing Company, and the J. Stevens Arms and Tool Company were represented by letter. The following memorial was adopted, and will be engrossed, to be sent to the family of Mr. Gould as a testimonial of the high esteem in which he was held:

MR. GOULD's character and personal qualities were such as to command the esteem of his associates and endear him to his friends. His daily walk revealed to us the high principles and worthy motives which governed his life. His influence was for good, and his life work was an important factor in the promotion of right thinking and practice in the special fields he had chosen for his own. As the editor of Shooting and Fishing his pen was ever enlisted in the cause of good sportsmanship, and his writings have had an important part in developing the popularity of the recreations of the field, and in creating that healthy public sentiment which now prevails respecting them. Mr. Gould was devoted to his work; in his last sickness his thoughts were continually of it.

It is fitting that those of us who knew Mr. Gould should thus give expression to our appreciation of the high character and usefulness of the life which has closed. His death has brought a personal loss to each of us and to the community. To those near and dear to him we extend our sincerest sympathy. There is the comfort which comes with the thought of a life work well done and a memory honored.

Natural History.

The "Joint Snake."

Editor *Forest and Stream*:

At last I have obtained a specimen of the joint snake while in a mood to make a careful examination. I never knew, until after perusing Mr. Hay's serial on reptiles (recently concluded in *FOREST AND STREAM*) that there was any question about the proper classification of the creature; what I supposed was troubling people was simply an unbelief in the existence of such a creature at all. My former article on snakes was published before I had read Mr. Hay's allusion to a similar (but, I now believe, different) reptile.

Squire Jester, of Wiggs, Ark., captured and sent to me the specimen now under consideration. I think it is only about half the size of some I have seen. Squire Jester says he often finds them in his strawberry patch. It is remarkable that he found this one so late in the year, especially as we have been enduring some unusually cold weather. But I had offered a reward for the capture of a real "joint snake," and nature seems to have appreciated my show of enterprise.

But, to the description: Length, 25½ inches; greatest diameter (about one-third of length back from head), ¾ of an inch, with very gradual taper toward each end; head, at eyes, one-half of the largest diameter; nose pointed, tapering, but not sharp; tail tapers to very small point. A single row of very fine, short, sharp, backward-curving, close-set teeth on each jaw, regularly disposed from one corner of mouth clear around to the other, i. e., the same in front as at sides—no difference in size, length or spaces between. They are all so small, however, as to entirely escape the notice of the casual observer—that is to say, in a specimen the size of the subject of this treatise. Eyes rather longish, hazel, expressive; more like those of a lizard or bird than a snake's—with fine, mobile under lid (no upper lid at all), so thin and pale as to appear semi-transparent. This feature (lidded, expressive eye), is the only unsnakeish outer one I can discover. Openings about one-third size of eyes, oblong, on a line with mouth, I judge to be ears, as I can find no passages from them to lungs, and it possesses nostrils—though very tiny ones. I at first took them to be gills, or remnants of what in its remote ancestors were gills, for I believe it may have descended from some sort of eel—an eel having a single, shelf-like fin running along each side, perhaps in an unbroken line, from mouth to tail, and extending slightly beyond the latter. My reason for this opinion (which may be of small value) is that a shelf of very thin, flat, flexible bone, or cartilage, extends all along each side of the spine, outward to the skin.

From an under view the reptile appears perfectly round-bodied; but a close inspection from above reveals that the upper half is composed of very narrow, flat sections—about 12, I make out—but, of course, there being so many in so small a space, the angles are very obtuse, detracting but little from the appearance of perfect roundness. I consider this a very important peculiarity. On each side, a little more than half way down, is a sort of seam, or depressed line, running straight from corner of mouth back about one-third of body (or, to be more exact, 8¾ inches), where it curves abruptly under to vent.

Although a dull color, the animal is so glossy and shiny as to present a very bright appearance. It is striped, as follows:

On the back a faint, dark-brown one, 3-32 of an inch wide, starting at back of head and continuing, unbroken, to point of tail. We'll call this No. 1. On each side of this, a pale, greenish-yellowish stripe, a little more than twice the width of No. 1. Next stripe below (No. 3), very distinct, very dark brown (nearly black), exactly 1-16 of an inch wide. No. 4, very narrow, less than half of No. 3's width, same color as No. 2, but looking almost like a white thread between the darker colors. No. 5, same as No. 3, but slightly narrower. No. 6, another fine, whitish line, almost a duplicate of No. 4. No. 7, like 5, but paler, slightly broken and indistinguishable forward of the vent; Nos. 8, 9 and 10 follow the order already given, excepting that they become paler as they are lower, 10 being nearly invisible, and 9 and 10 are seen in front of the abdominal region as well as to the rear of it. At a distance sufficient to blend the colors, the general effect is a bright, yellowish brown (in sunshine).

Now I approach, with some diffidence, the most wonderful part of the description—the part to which I fear I shall be unable to do justice. The joint! The joint so different from other joints, in other creatures! The magic joint which makes all the difference between a monster—a fairy—an enchanted creature—and a plain, every-day animal! Indeed, the more I contemplate this intricate and novel mechanism, the more I am amazed!—the less faith have I left in "human knowledge"—the less am I sure that anything is impossible! I begin to hope we may yet discover a man with wings (of his own growing)—or a woman who is willing to wear a really becoming hat that is "out of fashion!"

I regret that I cannot give the number of joints (back of the vital regions), as, when I had pulled off about twenty (certainly no less), my heart failed me—for they curved, wriggled and grasped my fingers deprecatingly to the last—although the reptile had been arrested, and nearly cut in twain (at the vitals) with a hoe, on Monday evening, and this was Wednesday, 10 A. M., Nov. 18—and it had been in a dormant condition until I began to do it violence, and had been exposed to freezing cold the night before, the thermometer indicating only 10 above zero in the morning. I had purposely kept it out of doors coiled up in a tin can.

The reason I cannot tell the exact number of detachable joints is, because they are very difficult to force apart (although the queer creature, if only frightened, or slightly tortured, and not injured, itself throws them off with little apparent effort), and I could never determine when I held a single joint; for frequently, when I believed I had such a small division, it would again divide, once, twice, or even thrice! I have rea-

son for believing, however, that the shortest possible section could not be less than three-quarters of an inch, from the fact that the projecting points of flesh in each section near the middle of the body were one-quarter of an inch long, the sockets of equal depth, and that would leave but one-quarter of an inch of solid flesh between. The points, which are three-sided wedges of soft, squirming flesh, always eight in number, exactly equal in size, form, and distance apart, with, of course, inverted cavities of exactly the same shape and diameter between, project at forward end of each joint about one-quarter of an inch. The rear end of each joint has no projections beyond the skin, but its cavities exactly fit the wedges of the fore end of the joint just back of it; and its wedges (which, remember, do not extend beyond the skin), end with very fine, curving, thread-like claws of flesh, waving about as if trying to grasp their departed sockets to take root in them again.

Let me remark, in concluding, that I observed nothing that looked like a fracture at any point of parting, of either bone or flesh, but that all unjointing seemed as regular and natural as if so ordained (although, in this specimen, there were very slight stains of blood on some of the spinal joints); that the skin, though thin, was hard, the scales so small as to be invisible to the unassisted eye; that, underneath, the skin opened in sharp cross sections or rings, like plows pointing backward, after the manner of true snake bellies (by means of which they propel themselves swiftly forward, though their power to run is a mystery to many people, and I once heard Old Uncle Dick Wright settle a controversy on the subject by simply declaring, "Boys, I'll ye—they jest move by faith—that's how!")—that I noticed, or felt, a slight, sticky exudation on my fingers, though I was careful not to touch anything but the skin; and, finally, I have about concluded that, after all, the creature may be able, under favorable conditions, to again unite its joints, else, why is it so admirably formed as if for that very purpose?

L. R. MORPHEW.

NOTE BY MR. HAY.

This very interesting and accurate description evidently has to do with the common joint snake *Ophisaurus ventralis* Linn., but with the western striped variety rather than the eastern checkered form.

The existence of this animal and its power to break into pieces has long been known, and unlike the hoop-snake and that fabulous snake which jumps or blows its poison many feet in pursuit of its victims, the joint snake is represented in scientific collections by numerous specimens. The classification of the creature is not a matter of any doubt. It is a lizard, modified for its peculiar habits by the loss of legs and the development of an unusually long body and tail, as well as by certain internal characters. Only by the uninitiated is it regarded as a true snake. The lizard characteristics, lidded eyes, single row of teeth, external ear openings, etc., mentioned by Mr. Morphey, are always evident, but he has failed to mention the fact that the belly of the joint snake is covered with small, overlapping scales instead of broad plates, as in the snakes.

The notes on the character and size of the joints are valuable, and are accurate so far as could be determined from a single specimen. When a joint snake breaks off its tail (and the tail alone can be broken) the line of breakage runs along the natural muscle divisions, which, in the lower animals, follow a zigzag course. This explains the forwardly projecting wedges of flesh mentioned in the description. The point of breakage of the spinal column is near the middle of each vertebra, where there is a cartilaginous plate, and not between the vertebrae as one might suppose at first thought. The length of the smallest possible section is thus determined by the distance between these points of weakness, and this will vary somewhat with the size of the animal, being shorter in small and longer in large individuals.

Regarding the power which the animal is supposed to possess of reassembling itself after its voluntary mutilation, we can only say that anatomists do not believe it possible. Mr. Morphey's conclusion that the complicated set of wedges and sockets seem adapted for this purpose might as well be met by the opposite conclusion, that so complicated a fracture would be extremely difficult if not impossible of readjustment. Nature has given the joint snake and the other lizards the power of growing a new tail after the loss of the original part; why has she done so if the animals are able to pick up the severed fragments, put them in place and crawl away with them?

W. P. H.

The Meadow Lark's Song.

Editor *Forest and Stream*:

There was a controversy of a friendly nature some months ago between Coahoma and another writer, whose *nom de plume* I forget, in regard to the merits of that attractive but fast disappearing habitant of our old fields known as the meadow or old field lark. Coahoma took the position that this bird had no attractive note or other trait or quality entitling it to protection, but that it was a fit object, by reason of its tempting flight, upon which sportsmen might practice their skill, and its ruthless slaughter was not the subject of legitimate criticism. The other party to the dispute (wasn't it Didymus?) modestly defended its claim to protection and consideration.

The position of Coahoma was utterly untenable, and it was with surprise and something of regret that I saw the position he assumed. The charming letters of Coahoma had often delighted me, and, as a fellow Southerner, I felt a certain degree of pride in his articles, and hence it was with a feeling of disappointment that I perceived his heartlessness toward one of the most attractive feathered denizens of our old fields. Here in the Old Dominion this bird is highly thought of and thoroughly protected by law. It is made a misdemeanor to kill him at any time. So far from being songless, he has several melodious notes of varying accent and pitch. In spring time, when his mate is nesting, he will sit upon the top of a tree and will utter flute-like strains.

These notes he will vary in intonations, and by descending to a lower key. How often from childhood have I watched him in the early morning or after a shower when the sun would come out, perched on the top of a distant tree, with his yellow breast, in which was a black spot, turned toward me, while he would sing his simple but sweet lay!

In that pleasing and well written book, "Bird Neighbors," this lark is spoken of in the following language: "Their clear whistle, 'Spring-o'-the-year, Spring-o'-the-year,' rings out from the trees with varying intonation and accent, but always sweet and inspiring."

While I am a constant reader of *FOREST AND STREAM*, the pressing duties of an active life have prevented my writing for it for a long time. Then I am beginning to feel alone, so many of my friends associated with it have ceased to write and departed hence—among them my dear friend and kinsman Wells, and Pisceno, the charming author of "Men I Have Fished With," Fred Mather, and others with whom I had become acquainted through the medium of *FOREST AND STREAM*, to which I have been a subscriber for more than twenty years. When I first subscribed for it I had just married, and had a bride who was still in her teens, and since it has been a weekly visitor to my house sons and daughters have grown up around me, one of the sons being now a member of the Virginia Legislature, another a physician in the city of Chicago, and the sweet young bride is a gray-haired matron. So we all feel toward *FOREST AND STREAM* as if it were an old unchanging friend, whose recurring visits we all look forward to with pleasant anticipation.

M. OF NORTHSIDE.

VIRGINIA.

Hawk, Owl, Crow.

THE great footed hawk or peregrine, is but an infrequent visitor to this locality, although he inhabits the whole of North and South America. The peregrine has powerful feet and talons, and is a relentless enemy of the whole wild fowl family, and will even boldly attack a sandhill crane or Canada goose. They are also gluttonish in their appetite for quail and chicken, as well as all kinds of game birds, but are so scarce even where the most common that the harm they do is inconsequential, and there is no especial call for their destruction.

The owls are a group of birds not to be confounded with any other. They have the features of their family indelibly stamped upon them, and by people generally they are associated almost wholly with the night time, but this does not hold good with many of them, nor do they all inhabit old hollow trees in the deep woods. The fact is, the owls vary much in their habits, as might readily be understood, as they are to be found from one end of the globe to the other. That they are a family of almost incalculable benefit to mankind, instead of being an injury and a drawback, is something that no even fairly well posted ornithologist will attempt to deny. That they do once in a while attack poultry, pigeons and game birds is of no significance whatever, when the immense number of rats and mice they will kill and devour is taken into consideration. It will be scores of years yet, however, probably, before the average farmer and gunner will appreciate the truth about these valuable birds, but the time will come when they will receive at the hands of our law makers the attention and the protection they deserve. Until the prevailing ignorance as to their real worth is overcome, the birds will have to continue, I suppose, to take their chances, but I earnestly hope and pray that extermination will not overtake them before the happy day of their recognition arrives. The owl is truly a sadly maltreated bird. By the average man he is looked upon as a tenant of the deepest woods, whose nocturnal gloom is rendered denser and more awe-inspiring by the ghostly dissonance of his voice. In poetry, from time immemorial, he has been regarded as the concomitant of darkness and evil, but when you become acquainted with the family you will know that there are many who have no connection with these associations whatever; birds that frequent the open instead of burying themselves in the tenebrous recesses of the wilderness; make their home within the earth and who delight to bask in the pure air and genial sunshine of our free prairies. This species of the owl is found all over Nebraska and on all the plains between here and the Pacific coast, and from the Canadian boundaries to the southern borders of old Mexico. That old fairy tale about these owls residing amicably in the same hole with rattlesnakes, badgers and prairie dogs is as ridiculous as the ancient hoopsnake chestnut. Just last night Florence P. Day told me that he killed a rattlesnake out in Arizona last July with a full-grown prairie dog in its stomach.

The snowy owl is a magnificent bird. He is circumpolar, but occasionally straggles down as far as this State. They hunt principally by day or in the early twilight and subsist almost entirely upon fish. But, as they visit this neck of the timber so infrequently, they hardly merit mention in this paper, and I speak of them briefly simply to show in what a silly prejudice they and their kind are held.

The great horned or Virginia owl is the wisest and noblest looking of the tribe, but like the Arctic owl is so rarely encountered out this way, that to treat him exhaustively would be a waste of space in this connection. He is a nocturnal bird and haunts the woods and lives much in hollow trees. His vocal abilities are celebrated wherever he is known, and by weak minded people believed to be a sound of evil omen. His destructive propensities are confined to rabbits, rats and mice, and hence the legendary old hooter deserves no place under the sportsman's ban. Neither do we have out here, in any conspicuous abundance, any of those little gray and brown owls, who are so common back in the Middle States. They are harmless. They rest by day in the hollow apple trees, and always too-hoo-oooo when the sun goes down, but few realize, or ever will, what blessings these little feathered clowns bestow upon the farmers, who, to a man, almost, persecute them remorselessly. The dear little fellows only

crave the shelter of the farmers' bug-ridden hollow trees in the day and the privilege of destroying the mice on the place at night, and yet the hard-hearted old yeoman is sure to lay at their door every missing chicken, duck or goose, overlooking the fact that only yesterday he saw a skunk run under the barn, and that the boys said that they had found the den of one of those bloodthirsty little thugs, the mink, down in the creek's bank.

These owls are literally capable of no injury to any one, and I would just as soon shoot a nuthatch, brown thrush or chewink as I would one of them.

While the long-eared is a well-known species in many regions, he is but seldom seen out this way. They are great mousers, frequent meadow lands in preference to other lands and are beginning to be regarded with some favor. The short-eared owl, his first cousin, is much like him, only is even a greater mice exterminator. He is quite common in this State, nests out on the open prairie and shows a decided predilection for the neighborhood of prairie dog towns.

The barn owl is known the world over. He rests inactive during the day, but comes forth in the gloaming and hunts mice with an industry that is truly commendable, but to expose himself recklessly near man's abode is to seal his own doom, for here is another instance where a useful and beautiful bird is hounded to death on account of idiotic tradition, dense ignorance and because it is an owl.

So much for the owls—now for the crow.

I am fully sensible of the fact that it requires considerable courage to champion the cause of the birds the whole world condemns, almost, but with me a universal impression is not synonymous with a demonstrated truth, as many claim, and while the crow is truly as black as he is painted, this sable hue is only feather deep. Our farmers always see the crows when they are engaged in their devilry, but never catch a glimpse of them when they are delving like Trojans in their interests. They feel the loss of the handful of corn he cost them yesterday, but have no thought of the dollars he will save them to-morrow in his destruction of ravaging insect life.

The crow is a friend of man. He is one of the greatest insect destroyers that wears feathers, and it is high time his true worth was being heralded throughout the benighted regions. A flock of crows in October and November does not range from one end of our fields to the other for mere exercise. These birds do not roll over dead branches and good-sized stones, scatter the matted leaves and dead grass and harry the runways of mice and gophers for the mere sake of doing something. Kill one of these crows, thus engaged, and examine his stomach and be convinced of the knowledge of those who have conscientiously studied the subject. The damage the crows do is so completely offset by the good they perform that statistics are not necessary. The part the ebony professors play as scavengers is almost entirely overlooked, and yet the part is played with the greatest of éclat, notwithstanding its minor standing in nature's ever enthralling drama.

It is my honest belief that in just proportion as birds are protected, including hawks, owls and crows, the pursuit of agriculture becomes less onerous and the use of poisons as insecticides a supererogatory expense. For a hundred years or more nature's quota of native birds has not been allowed to freely roam the country over, and the difficulties of contending with the particular foes of each crop have increased.

Facts may be stubborn things, but they cannot withstand the assaults of deep-rooted prejudice. A few cucumbers or a hill of corn destroyed, even if the crow is not the culprit, condemns the bird, and facts are no more regarded than idle words. Is not the crow black and does not that mean everything? Man admits himself by acts if not by words, a victim of brutish unreason, and willingly clings to the folklore of antiquity, as if it were susceptible of mathematical demonstration.

Elaborate argumentation is lost.

I will admit the crow is very black, and not startlingly graceful; he is anything but a musician and unfit for the table, but for all this we cannot afford to remove him from the landscape, from which all wild is too speedily vanishing. The sky grows weary when you gaze up into it with nothing to relieve its monotony, and whether one crow or a flock breaks in on the vision, it is a distinct gain to the outlook.

Take our great plains now, from which the bison has disappeared, and even the coyote is going, and you will find it very depressing looking forever in vain for solid, substantial assertive forms of wild life, and the crow is certainly one of these forms. The poetry that surrounds the raven is lacking, but the bird has charms all his own, although known to so few of us. Man has been judging the crow ever since the most ancient days and not yet begun to cultivate his acquaintance. When this is done all things corvine will not be considered unworthy of notice. Perhaps the invidious will say that I care more for birds than I do for business, for crows than crops, and I certainly do, and all they can say will not warp or vitiate my judgment.

I am fond of the crow because he is as cunning as he is beautiful, and because he has often outwitted me, and I am his staunch defender because, with so much against him, he has defied mankind, and in its very midst often lives a long life in safety. Certainly there is no other bird that offers so fine an opportunity for the study of comparative psychology. He is a living contradiction that intelligence is greater in mammals than in birds, for no four-footed beast, not even the collie dog at his best, is the crow's intellectual equal. This will be disputed, of course, but the final disposition of the question does not alarm or annoy me.

Have you ever watched the evening flight of the crows in the bleak autumn time? If so, you will never weary of seeing the sight over again. There are thousands and thousands of crows here in Nebraska, more, I believe, than in any other State in the Union, and there is no other spectacle in nature that fits so completely with the surroundings as the afternoon processions above mentioned. In the morning the crows scatter as so many individuals bent upon personal errands

only; some hurriedly, many in a leisurely way; some garrulous, others moody. Comradeship is not desired. Before the morning is well advanced the neighborhood is deserted, and the cry of the ever disgruntled jay seems but a mocking echo of the wild clamor that so lately resounded along the tortuous byways of this little wilderness; but as the day draws near its close, low down along the ambered horizon, we can, if watchful, mark the approach of the returning birds, and then for hours there passes overhead an endless army of sable forms, progressing with method, as well drilled troops rather than individuals, and obedient to the orders of their appointed leaders.

And in the sweet spring time, what a boon to the lover of nature is the crow. Long before the bluebird's note is heard dropping from the skies, before the liquid trill even of the song sparrow ripples upon the air, before the soft breath from the southland enpurples the fields and fans the sweet anemone into color and starts the shrill orchestra of the hylas in the wet meadows, he forms the vanguard of the glorious vernal season.

If there are any readers of *FOREST AND STREAM* who think I have fallen short of what I have undertaken to do, to defend these mis-called birds of prey, all I can add is that it will be wise to prove beyond all doubt the desirability of rendering extinct any form of life before the act is done.

We, unfortunately, have no resurrective power.

In conclusion, I will say that I consider it downright culpable to find an experienced sportsman at this late day who unblushingly asserts that he has given the subject of birds of prey in relation to our feathered game long and careful study, and yet urges the indiscriminate and persistent slaughter of the former, and claims that the ever increasing scarcity of the latter is due to the former. The investigations made by the Department of Agriculture, as long back as 1893, should forever set at rest all doubt as to the true economic value of hawks and owls. These investigations, which involved a critical analytical examination of the stomach contents of 3,000 hawks and owls, showed that among this enormous number only two hawks and one owl are appreciably injurious to agriculture.

SANDY GRISWOLD.

OMAHA, Neb.

Grizzly Bears and Others.

MONTANA in his story of "Grizzly Bear Bottom" in a late number mentions the grizzly and brown bear and seems to think that the brown bear is also a grizzly. I had been taught that the big brown bear often met on the upper Missouri was only half a grizzly, a cross between a grizzly and a black bear. How is it?

I have met but one real grizzly, and cannot claim to have met him; I got out of his road and let him keep on to wherever he was going. I only had a Spencer carbine and thought I had not lost any grizzlies; I was not hunting them, and he did not hunt me. Since then I have often thought that I was a fool for letting him go; I might have turned loose on him with the carbine, then when he came for me, as he no doubt would when I had hit him, I still had my pistol to fall back on.

There is hardly any doubt now that the real California grizzlies (and this one I met was one of them) are not half so eager to attack a man now as they were before the advent of the magazine gun. They have learned to fear him.

The big silver-tip of Arizona is only another type of the grizzly. I have shot him, but I had a good rifle when I did it, else I probably would have let him go also.

CABIA BLANCO.

[There is no reason for supposing that the different species of bears hybridize, any more than do the different species of deer. The belief is more or less common, but is shared by no competent biologist, so far as we know. Except under domestication, such crossing is, we believe, absolutely unknown among mammals. On the other hand, it does occur—and not very infrequently—among certain groups of birds, e. g., among ducks, and perhaps very rarely among other birds.]

Birds of a Maryland Farm.

UNDER this title, Dr. Sylvester D. Judd, in Bulletin No. 17 of the Biological Survey, gives us a local study of economic ornithology which is very interesting. While the Biological Survey has long been engaged in investigating the food habits of birds by the examination of the contents of their stomachs, this investigation while very useful so far as it goes, yet leaves much to be desired. Little or nothing may be known of the conditions under which the birds live whose food is examined, and this is an important part of any such inquiry. With a view of settling this part—for a limited territory—Dr. Judd made an investigation of the bird life of a certain farm in Maryland by frequent visits between July 30, 1895, and July 24, 1902. These visits included every month of the year except January. In order to obtain an idea of the available food supply, the insects, berries, and seeds found on the place were collected. The conditions of the crops and the insects feeding on them were noted. Observations of the birds' food habits were made in the field and in the stomachs of nearly 700 birds collected and examined.

In this Bulletin of 116 pages, which is illustrated by seventeen full-page plates and forty-one figures in the text, there is thus a vast amount of information given concerning our familiar eastern birds. The topography of the territory under observation is described, the distribution of its birds, their insect, vertebrate, fruit, grain, and weed seed food catalogued, and finally the species are enumerated and the food of each given, as determined by this long period of observation.

Dr. Judd's conclusions are that on this particular tract the English sparrow, the sharpshinned and Cooper hawk and the great horned owl are injurious and should be killed at every opportunity. The sapsucker is also harmful here on account of its injury to the fruit trees. The crow does more harm than good, while the crow blackbird is rather a beneficial species. Practically all the other birds are useful rather than harmful.

A very important service, according to Dr. Judd, is the

wholesale destruction by birds of weed seeds. If they were useful in no other respect the preservation of these birds would be desirable for this reason alone. Among the most active weed destroyers are the quail, dove, cow bird, red-winged blackbird, meadow lark, and a number of species of our native sparrows.

A. A. S. Meeting.

THE fifty-third annual meeting of the American Association for the Advancement of Science is to be held in St. Louis, Mo., from Dec. 28, 1903, to Jan. 2, 1904. At the same time there will be held meetings of various affiliated societies, among them the American Anthropological Association, the American Chemical Society, the American Mathematical Society—Chicago Section—the American Microscopical Society, the American Physical Society, the American Society of Naturalists, the American Society of Zoologists, the Association of Economic Entomologists, the Association of Plant and Animal Breeders, the Astronomical and Astrophysical Society of America, the Botanical Society of America, the Central Botanists' Association, the Geological Society of America, and others.

Special rates will be given over most of the railroads from different points in the United States to St. Louis.

During the meeting excursions will be made to the World's Fair grounds, where the progress of the work being done may be inspected.

North Carolina Audubon Society.

THE wardens employed by the Audubon Society of North Carolina continue to make seizures of partridges—commonly known in the North as quail—which are being shipped out of the State. At Greensboro, December 7, 71 birds which had recently been seized were sold at auction. The work of game protection now being done in North Carolina offers an example which all the Southern States and many of those in the North might very well follow.

Take inventory of the good things in this issue of *FOREST AND STREAM*. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Game Bag and Gun.

All communications intended for *FOREST AND STREAM* should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Ruffed Grouse and Woodcock.

HYDE PARK, Vt., Dec. 14.—*Editor Forest and Stream:* In response to your request for members of "the family" to report to you as to the number of grouse and woodcock in their localities this season, will say that I have hunted this section more or less each fall, for the past twenty years and never found grouse so scarce as at present. The season of 1902 we considered very poor, attributing it to the unusually wet spring. My total bag was about thirty birds. This season I have shot about a dozen, hunting practically the same covers. A month or two before the season opened the prospects seemed very good for a fair crop of birds. While out walking a number of broods were flushed, and in one case a flock of fourteen or fifteen birds. This covey I naturally tried to keep track of. They were located late in August, but on opening day (September 1) an hour's hunt in the rain failed to raise them. A day or two after I found them and secured two. They were then very wild, though I doubt if they had been shot into by anyone else. On dressing these two birds they were found to be infested with white worms about an inch and a half long, pointed at each end, which I suppose are the intestinal worms which attack the grouse. Although this same cover and the adjoining fields were thoroughly worked over by a pointer and setter at least a half dozen times later, these birds were never found together again, and only a very few scattering birds were raised in the whole piece of woods. For no better reason I attributed the disappearance of this covey to the intestinal worms, and of the dozen or so birds shot all but one were found to contain more or less of the parasites.

Another reason for the scarcity of birds this year I believe is the lack of food. In this locality there were no blackberries or nuts of any kind, and there have been no beechnuts, which are the staff of the smaller wild life in this section, for a number of years. I do not remember of seeing a chipmunk in all my fall's hunting. There were a few reds and very few grays. In seasons of plenty of food every stump and log will have its striped inhabitants. If the scarcity or abundance of food affects other wild life to such an extent, it must somewhat affect the grouse; and I believe that in this land of snows the Fish and Game Commission might do a more foolish thing than to attempt to provide feed for our native birds. How this could be accomplished is certainly a problem. A friend has suggested sunflowers as a possible solution, as they would grow on most every soil and hold their seed-laden heads above the snow. Grouse have already been budding here for more than three weeks, and their diet of birch buds will have to continue for three to four months more.

I therefore think that a number of conditions covering the past two or three years is responsible for the scarcity of grouse in this section. There is the undeniably poor

nesting season of 1902. That spring two nests were observed and only a small number of eggs in each hatched, and the broods found were in every instance very small. There was little feed for them that year. The nesting season of 1903 promised better during the drought, but the last of May there came a freeze which killed the beech leaves and in many places the maple, and even froze the ground. This must have chilled many eggs. Then came the intestinal worms to attack the survivors.

But least of all do I attribute the scarcity of birds to the shotgun, for there has been no more hunting in this section for the past five years than the preceding five, and five years ago birds were apparently holding their own.

Woodcock have been found in little better numbers this season than last. A day's hunt in their covers resulted in a bag of four out of a possible six and two grouse, a red letter day for this season and section.

H. A. NOYES.

MONGAUP VALLEY, Sullivan County, N. Y.—*Editor Forest and Stream:* It is not many years ago when you could get good shooting on Long Island for ruffed grouse; from there the sportsmen moved up into Westchester and so on into Rockland and Orange counties. They are now killing what few there are left in Sullivan county, and a more natural abode for this bird cannot be found than right here in Sullivan. Within the past twelve years I could go out and put up from one hundred to two hundred birds in a day; last fall if I put up fifteen birds in a day I was doing exceedingly well, and one day in particular, after a whole day's tramp, I came home without having flushed a single bird, and I hunted over as good ground for these birds as there is in the State.

It seems to me a perfect farce to protect the Mongolian pheasant and leave the only American game bird we have at the mercy of everybody. The ruffed grouse is a bird you cannot propagate, while on the other hand the pheasant can be reared like barnyard fowls, eggs can be bought and hatched out under hens, and when large enough to take care of themselves can be turned loose. When it comes to the sport of hunting these two birds, the pheasant is not in it with the grouse; he will not lie like the grouse and give you a decent shot; nine times out of ten he will run like a running horse and then flush clear out of shot.

It seems as if the importation of the pheasant here is for a few millionaires who want to ape their English cousins, having their hunts with their game beaters to drive their game into an opening, where, if they keep on shooting, they are sure to kill some birds. I would like to see a lot of game beaters driving out ruffed grouse. I think the bag would be small at the other end of the line. Is there any sport more pleasant than to go out with a well broken dog and to enjoy the working of your dog as much as you do the killing of the birds? I for one would like to see this coming Legislature pass a law protecting the grouse for three years, and if things are allowed to still go on as they are now, it will not be many years before this, the gamest of all game birds, will be extinct in this State.

HOWARD TILLOTSON.

PITTSFIELD, Mass., Dec. 15.—*Editor Forest and Stream:* I wish to congratulate you on the fine appearance of your Christmas Number. It is a beauty; while each page is replete with good things, one cannot but express appreciation of such fine illustrations as the Albatross at Home, Mule Deer in Yellowstone Park, Attraction, Temptation, and Satisfaction. This last must appeal to many sportsmen.

Regarding your inquiry about ruffed grouse in western Massachusetts, particularly Berkshire county, they have been very scarce the past season. But in New Brunswick, where I spent six weeks in September and October, they were very plenty, both birch and spruce, with some of the handsome juniper.

On many trips, both to Maine and New Brunswick, I don't think I ever saw so many partridge in the deep woods as on my last trip. Last year in the same region, I saw but very few. Perhaps the past season there was more favorable than elsewhere for the young birds, or maybe they had heard that they were to be protected for three years, and had just come out of their retreats. Whatever the reason, they were there in very large numbers.

One of the guides, returning from the settlement (where he had been on sick leave), remarked that had the law allowed, and had he been disposed, he could have filled a barrel on his way in.

However, as I believe in observing the laws, also a rule of my own not to shoot at any other game when moose hunting except what I am after, I disturbed them only with a "shot or so" from the camera, which, as it turned out, were as barren of results as was the film that I tried to expose on a deer at thirty feet.

I wish the grouse here in Massachusetts could have a close time for three years, too. I believe it will have to be done or in a very few years they will be classed with the Labrador duck.

CHAS. D. BUTLER.

NEW YORK, Dec. 15.—*Editor Forest and Stream:* A friend of mine who lives and hunts in New Jersey, about eight miles from the New York City Hall, says he had good woodcock shooting this fall, and would have done better if he had known the ground as well as he does now. He flushed as many as twelve in one day. The first day the law opened on quail he found three bevs, but could not do much with them, as they were in very wet bogs. I found quail unusually scarce and quit hunting them. None of your correspondents mention that woodcock are killed in great numbers all over the United States, by flying at night against the overhead trolley, telegraph and telephone wires.

Stubble Rhymes.—V.

Hail to the chief, the brave ruffed grouse!
Hail to the drumming "partridge!"
The whirring "pheasant," stately bird,
And a scatter gun a-la-cartridge.

We heard him on the rugged hills—
When all the woods and fields were green,
Sounding a vernal reveille
That echoed all the vales between;
And there his mistress made her nest
Beneath a prostrate, shattered pine,
Her garb so like its mouldering bark,
Her bright eye was the only sign
Of life to meet one's eager gaze
When toiling up the steep incline;
Whence presently she led her brood
When mountain paths were sweet in June;
All nature breathing harmony
And every living thing in tune.
How quickly rose her warning note;
As quickly disappeared each chick;
Away she limped with drooping wing,
Hoping to lure us by the trick.
We know my lady's ruse too well,
And stooping down each leaf is scanned,
Till one, raised slightly from the ground
Is covered by a gentle hand.

Behold a ball of brownish down
Scarce larger than a bumble-bee,
Confiding in the open palm

This royal trophy of his skill,
And notes the pinions rounded, strong,
The marbled breast and banded tail,
The brown-black, iridescent ruff
Cold gleaming as a coat of mail,
While Tony sniffs the crested head
And gently mouths the drooping wing.
No other game bird can compare!
Who know him best his praises sing.

Then seated where the soft winds play
In cool refreshment on his head
The hunter scans the hill, the sky,
Scenes beautiful before him spread:
Ensanguined hosts the woodlands sweep
And dip the sumachs deep in blood,
While colors of the rainbow crest
The billows of the crimson flood
Which upward roll until the glow
Of sunset skies, deep, ruby red,
Appears a molten coronet
Upon the forest's flaming head:
He feels a keener, deeper joy
Than for the game to ceaseless fag:
It is not all of life to shoot,
Nor all of sport to fill the bag.

But hark! What is that measured beat
Repeated thrice and followed by
A thunderous roll like call to arms
Of distant troopers of the sky?
Scarce thirty yards adown the glade
His lordship struts a fallen tree,
Wings forward bent and head upstretched

HE WALKS ALERT AMONG THE FIRS.

And resting there quite fearlessly:
We note its marks and bead-like eye,
Then set the little captive free.
How wondrous tame maternal love
This wild, shy, woodland bird has made!
She flutters where the sinking sun
Casts our attenuated shade:
A few soft notes and scattered brood
Are led in safety down the glade.

When dusty August's parching breath
Was withering every verdant thing,
We found them cool amid the ferns
That grow about a mountain spring
Where oft we stopped to quench our thirst
And listen to its waters sing.

When Autumn's parti-colored troops
The hills invest, the vales o'errun,
The scattered broods make royal sport
For hunters with the dog and gun.
How stealthily he skulks behind
A fallen log, until his foe
Has passed, and then on whirring wing
To rush away and swiftly go—
A brown streak flashing through the trees,
Or hurtling headlong down the glen:
In vain the tyro tries his skill!
Fine work it is to stop him then.
Or when the nervous setter stands
Transfixed by odors subtle, sweet,
He slyly runs to denser shade,
Then up on silent wing and fleet
Leaving the baffled pair: the dog
Moves slowly on, then wildly flies
Now here, now there; the hunter smiles
And follows up the vanished prize.
His search rewarded at the base
Of brushy hill or fern-clad slope;
A glimpse of wings far up the height
And glimmering goes the sportsman's hope.
"Faint hope fair lady never won!"
He upward climbs nor stops to rest
Until those tantalizing wings
Swoop downward as he gains the crest;
But quick as thought the brown tubes fall
In line where last those wings were seen;
The vales re-echo with the shot,
The quarry falls on hillside green,
And waves of exultation roll
To brother guns: he feels the thrill
Of satisfaction as he strokes

He beats an autumn reveille
Almost beneath the hunter's gun,
Who scorns to shoot him as he drums,
But waiting till that throbbing wing
Subsides, then startled upward hums,
A living rocket from the gloom
Through treetops waving in the light;
'Tis then the sportsman has a glimpse
Of phantom brown o'er muzzle sight.
Unconscious of the trigger play
Or loud report, but holding fair,
He marks the quarry hesitate
And then collapse and cut the air
In swift descent to frosty earth.
How eagerly the setter then,
Hearing the welcome, kind command—
"Hie on and fetch!" the grouse retrieves
And drops it in his master's hand
With every evidence of pride
And pleasure in the strenuous strife
Of ruffed grouse shooting in the hills—
High water mark in sportsman's life:
Too strenuous for carpet knights
Who bag from armchairs many a brace;
But Nimrods strong of wind and limb
With eager foot and glowing face
Pursue the quarry till the sun
Stoops westward to his resting place,
And trophy's won or day is done.

Who makes a double on ruffed grouse
Is numbered in the Red-Ruff Clan—
Diana's first-flight favorites.
Attain the eminence who can.
And when the frost-king's fleecy host
Has hushed the music of the hills,
He walks alert among the firs
That deck the swamps and lower hills,
From whence the north wind's biting breath
Has driven every tender wing.
How dauntlessly he breasts the blast
And vigil keeps until the spring
Awakes the music of the streams
And love's warm currents move the world,
And forest choirs renew their songs
Above the flowers anew unfurled.

Then hail to the chief, the brave ruffed grouse!
Call him "pheasant," call him "partridge":
Long may he live to test your skill
With a scatter gun, a-la-cartridge.

ALMA

How to Cook a Duck.

NEW YORK, Dec. 14.—*Editor Forest and Stream:* In the cooking of game birds two points—according to my view—must constantly be remembered: a white meated bird is to be thoroughly cooked; that is to say, must show no red in the flesh of breast or legs; a dark meated bird is to be cooked rare, that is to say, when carved the red juices should follow the knife. Though a white meated bird should be thoroughly cooked, it should not be dried up. The tendency in cooking white meated birds like quail is to cook them so thoroughly that the legs become hard and dry and the breast muscles are dried up and chippy, and really hardly more toothsome than so much poplar wood.

It is perfectly well recognized—and the FOREST AND STREAM has called attention to it many times—that the flesh of birds and mammals takes its flavor from the food on which the creature feeds. Therefore if the flesh of a duck, let us say, has a strong taste, as often have the mergansers and many sea ducks, it may be permissible to disguise this flavor by the addition of other flavors. I can conceive that a merganser, a coot, or an old squaw might be improved by a dressing of which onion, sage, and other strongly flavored herbs might form a part, or that jellies or highly flavored sauces might render them more palatable; but I believe that, given a bird whose flavor in itself is delicious, any attempt to improve that flavor is dangerous. For example, I should never think of using jelly on a canvasback, redhead, or widgeon. These are birds which in many sections have a distinct and pleasing flavor of their own, drawn from the food on which they subsist. Yet nothing is more common than to see currant jelly served with good ducks. This I believe to be a great mistake. I would no more eat currant jelly with canvasback than I would mar the flavor of a good cup of after dinner coffee by mixing with sugar or cream.

Believing, as I do, that a duck should be cooked rare, I still think that it should be cooked through. The oven must be hot, the bird without dressing—i. e., its visceral cavity empty—will cook from within as well as from without, and the operation will be performed quickly. Ovens, like cooks, have their idiosyncrasies, and the men and women who are to eat the ducks have different tastes. Therefore laws may not be laid down; only opinions can be expressed.

As the tendency is to cook ducks too much, so it is to dry up and destroy the flavor of the toothsome sora, snipe, and woodcock, three of the most delicious of our American birds. Like the ducks, all these birds should be cooked quickly, and if it were practicable in these days, which too often it is not, should be cooked before an open fire, whether in what is called a Dutch oven or on a spit, or on a broiler.

Beware of sauces which shall destroy the native flavor of the bird. Eschew onions and jellies above all things. And above all things see that your birds, whatever they are, be served absolutely hot, and that your plates are hot.

SAGE.

Editor Forest and Stream:

The best methods of cooking ducks has been properly engaging the attention of some of the correspondents of FOREST AND STREAM of late; and like the public discussions of many important questions, this is likely to bring out a good many interesting and valuable items of information for the benefit of those who are fortunate enough to acquire the toothsome canvasback or mallard, and to be in harmony with those who can cook with judgment and discretion after tried and approved recipes. Tastes differ radically in regard to the matter, and there was never a recipe in this world for cooking anything, flesh, fish or fowl, that would suit everybody—not even terrapin stew. Some people say, put no dressing or stuffing into the duck to be roasted, some advise putting a small onion into the carcass to be roasted with it. One man wants a duck to come to the table cooked to the ruddy turn, so that the flesh when cut, shall exude blood red juices. His neighbor, on the contrary, prefers his bird roasted "a good, wholesome brown" all the way through.

Among other valuable things to be found in one of my scrap books, is a clipping from FOREST AND STREAM without date, I regret to say, but well back in the '70s, I think, which gives a sensible method for cooking canvasback ducks. My cook has tested it and it proved up all right, according to my own taste, and those of my guests who have partaken of it. There is one thing that must be remembered in dealing with any formula or cooking recipe, that for every ounce of theory you must use at least two pounds of common sense. Here is the *modus operandi* that I have referred to, taken from the scrap book aforesaid—and this little dissertation will be made to occupy the space from which the clipping came, and I hope that it will occupy a space in the kitchen of many a lover of that most satisfying delicacy, a well roasted and well served canvasback:

"To Bake Canvasback Ducks.—Have the duck dry picked, the head left on. No dressing is to be put into the bird, except a little pepper and salt. Place the duck in the pan on its back; if you care to add a slice of dried English bacon, not smoked, do so. Put no water in the pan. Your oven must be hot, but not enough to burn. Baste the duck frequently while cooking. About thirty minutes is the allotted time. During the last few minutes dredge some flour on the bird and quicken the fire, in order to brown the outside.

"The above are general directions for an ordinary range or cook stove; but it is impossible to give the exact time that a canvasback duck should remain in the oven, as this depends altogether on the size of the oven, the condition of the fire, the number of ducks to be cooked at the same time, whether the ducks have just come off of the ice, etc. You can tell the temperature of the oven by holding your hand in it a moment, and if you are familiar with your oven you will know just what it will accomplish. If you have baked the canvasback as it should be baked, it must have a plump appearance when taken out of the oven; in color it must be a delicate brown. The flesh, when cut into, should be moist and juicy, and in color somewhat red—not blue.

SPANIELS AND COCK SHOOTING.

OLD TYPE SETTER.

Pictures of Old Time Shooting.

THEY did not have kodaks in those days, but no doubt the lithographs of field scenes gave perfect satisfaction to a taste less exacting than that of to-day. Certainly the very crudeness and quaintness of these "sporting

views" make them all the more interesting, as they are here taken from musty prints and reproduced for the eyes of this generation. The pictures are from Hodgson's Sporting Views, and were published in the early part of the last century. Not the least interesting feature of the prints is the illustration of the old types of field dogs.

"Game birds in general, and canvasback ducks in particular, must be subjected to a certain amount of heat for a certain length of time before that chemical transformation can take place in their flesh and blood necessary to make apparent to the human palate that flavor peculiar to the bird. In the uncooked bird the flavor is present in a dilute form; it needs heat to drive off the water and thereby concentrate the juices. In the overcooked bird you have approached too near to charcoal, a substance without flavor. Just where to stop between these extremes we have endeavored to instruct you.

"The man that wants his bird dried to a crisp does not like the flavor of that bird, and would have you destroy that flavor with fire. The man that says, 'cook my canvasback twenty minutes by the clock,' and then to eat it covers a warm slice of the raw, blue flesh with currant jelly, or Worcestershire sauce, does not know much about the delicious and delicate flavor of the canvasback duck. A tender sheldrake, or anything to form a foundation for jelly or sauce, will do for him. Have all your game as fresh as you can get it after the animal heat has passed off. Putrefaction does not add to the flavor of any game. To any one fortunate enough to possess a 'spit,' to him I say, never trouble your oven with a game bird.—H. DeG."

There you have it, and the rest remains with the duck and the cook. FRANK HEYWOOD.

Editor Forest and Stream:

Dr. Morris in a late number gives four ways to cook a duck, and his fourth one is the way I would want to cook it, or anything else that can be cooked that way. I have used the kettle and the hole in the ground to bake beans in, even when I had almost any sized Dutch oven I could have used; but the beans would not have tasted so good if I had used the oven.

One advantage a camp kettle sunk in the ground has over the oven is that it can be filled, then left there all night; if there are any coyotes in the country they are not likely to empty it before morning.

I have had them waste a good deal of their time in trying to get the hot lid off an oven and not burn themselves. The first one which had been detailed to remove it had no doubt been burned, and the others would be busy trying new plans to get into the oven, when I found them at it and put on more coals to keep it hot.

CABIA BLANCO.

The Massachusetts Association.

BOSTON, Dec. 19.—*Editor Forest and Stream:* Last Thursday evening the December meeting of the Massachusetts Fish and Game Protective Association was held at the Copley Square Hotel. A meeting of the Executive Committee of the Massachusetts Central Committee for Protection of Fish and Game was held at 4 o'clock, Chairman H. A. Estabrook, of Fitchburg, presiding.

Former Chairman A. B. F. Kinney, of Worcester, said the scarcity of partridges in the central portion of the State this year had been so great as to cause much anxiety lest the birds would become extinct in that quarter unless more restrictive measures are adopted. He said that he was sure there would be some petitions presented to the next Legislature for more stringent measures, either asking for a limit of the bag or a reduction of the time allowed for shooting. President Reed said that in tramping through the woods of Sandwich and in traveling on the highways since the close of the shooting season he had seen more partridges than during November, and in that section he is of the opinion that there is a good number of birds left over. Chairman Estabrook, while admitting that he had found the birds less numerous in towns where he has hunted this season than they were a year ago, said he had found them fairly plentiful this year as compared with some previous seasons.

The committee took no specific action on the subject, deeming it wise to await further developments.

Your readers will recall the name of Mr. Wm. B. Phinney, of Lynn, who was a member of the executive committee since its formation in 1899, and whose death occurred a week ago. As a member of the House and of the Committee on Fisheries and Game the past two years, Mr. Phinney has rendered excellent service in the cause of protection. A practical sportsman for many years, his first efforts in the interests of sport resulted in the organization of the Lynn Fish and Game Protective Association, of which he was president at the time of his decease. Suitable resolutions were adopted by the committee, and the secretary was instructed to send a copy of the same to his family.

The attitude of the committee as regards legislation the coming winter, so far as developed at this meeting, is likely to be in favor of such changes, if any, as the commissioners may recommend in their forthcoming report, and Chairman Collins, who was the guest of the State Association in the evening, expressed an earnest wish that means be found to facilitate securing warrants, and that the right of search be so much extended that when a warden feels sure from existing circumstances that a man has been violating the law he should have such authority as to enable him to secure the evidence needed to secure his conviction.

Heretofore Massachusetts legislators have been unwilling to allow the search of the person of a hunter for evidence of guilt, claiming that the privilege is liable to abuse. The deputies and other officers may search for and seize, without warrant, any smelts which they have reason to suspect were taken illegally. For enforcing the provisions of the lobster law, "any commissioner or deputy, or any member of the district police, may search in suspected places for, seize, and remove, lobsters which have been unlawfully taken, held or offered for sale." For one, I see no reason why such a provision should not be made for searching the premises of dealers and cold storage warehouses for game illegally taken or held. I see no reason why such a privilege is more liable to abuse when applied to game than when applied to lobsters.

Besides Chairman Collins, other speakers at the Association meeting were Mr. Herbert E. Tuck, of Haverhill, and Chairman Estabrook. Dr. E. W. Branigan presented

the list of officers prepared by the nominating committee for the ensuing year. The election will be held at the next meeting on January 13.

Commissioner Wentworth, of New Hampshire, says he thinks the number of deer killed in that State is about the same as last year. The sum received for licenses is about \$1,200, which will be turned over to the detective fund.

The summing up of shipments of game from Bangor at the close of the hunting season shows 4,602 deer and 208 moose, as against 5,250 deer and 189 moose in 1902. Speaking for Washington county, Warden G. W. Ross says the season has been marked by "an abundance of game and comparatively few hunters." Some sportsmen returning from Aroostook county report seeing one herd of eight caribou and another of seven. This may indicate those animals are returning to Maine. CENTRAL.

The Cuvier Club.

In a New Year address to the members of the Cuvier Club, President Alex. Starbuck writes: Our membership is fast increasing in numbers, and as our organization becomes larger we hope to make our influence bear strongly toward the enforcement of our game laws.

As parents, we restrain our boys from either killing the birds or destroying their nests. We must inculcate

In Rhode Island.

WESTERLY, R. I., Dec. 11.—*Editor Forest and Stream:* I have shot more woodcock this fall than I have ever shot before; in fact, this has been the best shooting for that bird in this vicinity that I have seen in ten years. It has been a common thing to start them right out in the open. Grouse have been seen in good numbers, but very wild; still there have been a great many killed. Quail have been very scarce; but I know myself personally where there have been several bevsies this past spring. I don't know what became of them; could not see them this fall. It must have been the heavy rains in June that had some effect on them. In all we have had a good season on most everything except quail. We also have quite a few pot-hunters who won't let anything live that comes within gunshot; but they are mostly Italians; some have been caught and given the full extent of the law, thanks to our game warden, who seems to be active this season. A READER.

Governor Aycock at Currituck.

OUR Governor spent a few days at Currituck this week, and while he does not profess to be an ardent sportsman, he is sufficiently fond of it to be a member of the Audubon Society, and during a very pleasant chat of an hour with him we found him alive to all interests pertaining to the protection of game in North Carolina. He has a

OLD TYPE POINTER AND SETTER.

within our daughters' minds a distaste for that adornment which has cost the lives of hundreds of birds. By advocating these measures we will sow the seed of humane feeling that will broaden and deepen throughout life and eventually make an impress upon public as well as upon individual character.

Laws are made in the interest of mortality, honesty and justice. These are enforced by the vigilance of our officials in public life, but let each member of the Cuvier Club consider himself an active official in supporting the laws which regulate the preservation of our game. It is a question of such vital importance that, to ignore it, would be criminal, and, moreover, denote degeneracy in the instincts of a true sportsman and a good citizen.

As an educational influence our museum will always be a medium for the benefit of the public or private schools, whose pupils can here behold the beautiful plumage and imagine the sweet strains these denizens of the woods can utter. The artistic work of Professor Dury has filled our cabinets with an endless and attractive variety from all parts of the world, which cannot fail to be an instructive object lesson to the receptive minds of the young, to impress them deeply as to the sinfulness of destroying even one member of nature's tuneful choir.

The past year has been a prosperous one. Many new members have been added, to whom we extend the hand of fellowship and welcome, for each new member will give us increased strength and power in advancing the ends we have in view.

From Currituck.

CURRITUCK, N. C.—Our shooting up to a week ago has been generally good. We have killed more canvasbacks here this fall so far than we have killed before in twenty years at the same season, and we expect good shooting through the winter, as we still have an abundance of game in the Sound. We have had some fine mallard shooting, like that we had three years ago, and in fact a large quantity of marsh ducks along with the canvasbacks. Swans and Canada geese have been unusually abundant, and some nice bags have been made; the writer made a bag of 36 canvasbacks within half a mile of his front door a few days ago, and at this moment they are to be seen in great numbers.

The clubs have had very good shooting so far and I think will continue to have. Our game wardens are vigilant, and while there have been very few arrests and convictions, it is because there is a general disposition among the gunners for market to keep the law. The sunrise law has been well kept, and there has been very little night shooting. There has been some kicking about the non-resident tax of \$10, which personally we think is a good thing, if the laws are to be well kept, as from this source the game wardens receive their pay.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

How to Boil a Fish.

Editor Forest and Stream:

My note on cooking ducks in last week's FOREST AND STREAM has brought letters from two old acquaintances. One asks, "Do you mean to say that the water in which a fish has been boiled is the only proper sauce?" The other says, "Tell us more in detail about cooking ducks and fish."

There's no use in trying to go into detail about these things. Two women will read a mathematical receipt, and they proceed to put in "about so much" of everything. The product of one will make a man leave his happy home for her, and the product of the other will make a man leave his happy home on account of her, and both women working from the same receipt.

If two yachts are built upon the same model, one will regularly out sail the other, and beat her on all points, year in and year out. I will try, though, to tell how to boil a fish. In the first place, buy the sort of fish that is being caught right then and there; never mind what kind. The man who goes out and buys bluefish in January, or pompano in Boston, is a man who will buy the kinds of cigars that are advertised on bill boards, and who thinks that all this world is a vale of tears. The woman who does the same thing is the one who bets on a horse because it has a pretty name. Cold storage has made our time the flavorless age. Game and fish are put where they will keep until you cannot tell a partridge from a shad with your eyes closed. Apples are picked before they are ripe, put where the chemistry of ripening cannot occur, and then put on the market at a time when their cost is highest and value lowest. Cream is thrown out of milk with a separator before bacteria have liberated the delicious ether, and is kept at a temperature that prevents anyone from getting anything good out of it, excepting the dealer, who pockets a profit.

But to return to the fish. Buy one that was not caught a single day too soon. Put handcuffs on the cook, and fasten her securely at some place where her squeals and kicks will not disturb other people. Take the cook book and turn to the recipes for boiling fish. tear out these leaves and start the fire with them. Pause, if you will, to read something like this: "Add ¾ cup vinegar, 1 small carrot, 2 onions, 1 bay leaf, 12 peppers, 1 bunch parsley." Great Scott! A fish that is in that stuff is in the soup for sure. Why add the fish at all? If it is a cold storage fish it will not hurt the flavor of the soup, but it fills the pot too full.

Having started the fire, put on the pot, and water enough. Put into the water a lot of salt pork cut into small pieces, and boil for an hour and a half. The object of this procedure is to fill the water so full of fat in mechanical mixture that the fine, delicate volatile flavoring matter of the fish will not be abstracted by the water, and dissipated with the steam. Cut the fish into pieces weighing about one pound each, and wrap each piece in cheese cloth or mosquito netting. The object in cutting up the fish is to have it cook evenly and not have one part spoiling while another part is getting ready to be good. The object of the cloth covering is to keep the flakes together and to allow neat skimming as the pot boils.

Put in enough pepper and salt at the end of about twenty minutes. Boil twenty or thirty minutes longer. Take out the fish. Take off the covering. Put on a little more pepper and salt. Put one piece on each platter, and pour over each piece a whole lot of the water in which the fish has been boiled, remembering that fish naturally swim.

Now the very nicest point in this recipe is one that cannot be written. The cook must accurately judge in advance about the amount of water that will boil down to exactly the right thickness at the moment when the fish is to be served.

ROBERT T. MORRIS.

Notes on Forest and Stream Items.

BY EDWARD A. SAMUELS.

ALMOST every number of FOREST AND STREAM contains matter that would furnish an inspiration and treat for more than one instructive volume. I have been greatly interested in the discussion on the "Red Gods," and once or twice wanted to add my quota to the opinions expressed. The sharp click of the iron-tipped pole that the canoe man uses in impelling his buoyant craft up or down the Canadian streams whose rocky bed would furnish a slippery and uncertain hold to the soft end of a pole not thus guarded, is a familiar sound to every salmon fisherman, but I refrained on account of the space that had already been occupied in the discussion, but there are general items in recent issues of the paper upon which I will make a few comments.

The Growth of Trout.

The article by Dr. Henshall printed in the December 12 issue is very interesting to me, and will prove valuable for future reference to those who are interested in such matters.

It was once said by Prof. Agassiz that it would require at least a score of years to build up such leviathans as the ten-pound Rangeley lake trout; he may have been right, probably was, but in my opinion the rapid growth of fishes depends very much upon the amount of food that is accessible to them.

There is a great abundance of food in the Rangeleys, an abundance more lavish than I have ever seen in any other waters; shoals of minnows many rods in length and containing thousands upon thousands of the little fish are often to be seen, and if a trout will take the trouble to open his mouth he could gorge himself without any other effort. The abundance of these minnows easily accounts for the rapid growth of the landlocked salmon that have been placed in those waters, which have already attained a weight of ten or a dozen pounds. Many years ago the progenitors of these fish in their native waters in which there was a continued scarcity of food rarely exceeded a pound and a half in weight, as I stated in my article in the issue for December 20, and elsewhere where similar conditions obtain the result has always been the same.

Undoubtedly fish culturists, or rather those who breed trout for the market, can furnish pretty correct data concerning the growth of these; but those fish are in captivity, and are gorged to repletion with chopped "plucks," or other cheap meat, and are not obliged to "hustle" for a living as wild trout are compelled to. I have no doubt that trout thus "stall-fed" will increase in size and weight very much more rapidly than will the others.

Dr. Henshall's figures are of particular value, for they relate to trout in their natural conditions. To show how trout increase in size if furnished with the proper environment and abundance of food, I will cite a single incident which came under my own observation.

In a field on my father's farm in Massachusetts there was a large spring; it had in bygone years been dug out to the depth of about six feet, and was about eight feet square. The sides had been loosely boarded up and the bottom consisted of sand and gravel. Its water was magnificent, almost ice cold at all seasons of the year, and as clear as crystal. A pipe had been laid from this spring to my father's house, and that of one of our neighbors, and an abundant supply of this most delicious water was always available. We were often much annoyed by the number of worms, spiders, grasshoppers, crickets, etc., that fell or jumped into the spring, and to do away with this nuisance I caught in a brook near-by, in which there were a few trout, none of which were ever known to exceed four or five inches in length, a single specimen, which was hardly more than a fingerling, and placing it in a pail of water hurried with it to the spring, into which he was dropped. He at once became reconciled to his new home, and in consequence of the abundance of food found therein quickly began to increase in size. Before he had been in the spring three months he became so familiar that he would dart up to the surface

face of the water and snap from my hand a grasshopper or worm that I held between my fingers.

In the third year of his residence in the spring that trout attained a length of over a foot, and must have weighed considerably over a pound, and no doubt would have continued to grow to a much larger size if it had been permitted to, but he was captured by some rascally poacher, and I was forced to seek another captive in the brook to replace him.

In this connection a short extract from Prof. George Brown Goode's work on the fishes of the United States, showing the rapid increase in size of the striped bass will be of interest here. He states that "Captain Gavitt, of Westerly, R. I., has caught bass in June that weighed from one-half to one pound, put them into a pond and taken them out the following October when they weighed six pounds."

Fish and Fishing.

Porpoises and Salmon.

The catching of porpoises promises to become an important industry of the Gulf of St. Lawrence. Captain Campbell McNab, one of the most observing of Cana-

almost have been made with a pin. For years McNab has held firmly to this theory only to be laughed at for his pains. He has now proved it beyond peradventure, however, and as the skin and oil from a single porpoise are often worth from \$30 to \$50, he is now in a fair way to reap the fruit of his persistent and intelligent perseverance.

Taxing the Trout in the Stream.

A WESTERN daily paper recently printed the following item:

"A million dollars' worth of brook trout, the property of Henry Clay Pierce, of St. Louis, have been attached by the officers of the town of Lake Nebagamon, Douglas county, for a tax of \$2,000, which Mr. Pierce has failed to pay."

A Milwaukee (Wis.) paper having inquired about the matter of Mr. Pierce, he replied as follows:

"During twenty-four years I have owned property on the Brule River, Wisconsin. In my efforts and expenditures to provide a safe haven for the brook trout having their home in the waters of the lakes and ponds which are entirely upon my property there, I have experienced far less annoyance from the Indians I orig-

is paralleled by the Chippewa translation. "Maskk" is in common use to-day among some of the Chippewas whom I have employed as guides, in the sense of meaning big and strong. "Kinonje" is the single and universal name for pike among both Montagnais and Chippewas wherever I have been among them. "Maskkinonje" is a word used by so many thousand Indians at the present moment that we ought not to have the slightest difficulty in getting this question settled instantly and for all time.

ROBERT T. MORRIS.

One of Mr. Young's Tarpon.

AN Aransas Pass tarpon, as beached and tagged, to be released that it may be caught by some other angler some other day. The metal tag is seen attached to the caudal fin. Stamped on the tag is the legend: "Aransas Pass, 1903. Report to FOREST AND STREAM. W. B. Young, New York." It is the Texas custom to release the big fish after they have been brought to shore and recorded; and Mr. Young has provided tags to be attached as here shown. We have recorded the recapture of a tagged jewfish.

The Kennel.

Russian Wolfhound Club of America.

NEW YORK.—The executive committee of the Russian Wolfhound Club of America take pleasure in announcing the complete list of specials offered under its auspices at the coming Westminster Club Show, February 10-13, 1904.

Attention is again called to the fact that ten regular classes have been secured, and with such a list of specials it is hoped that the exhibit will far exceed in numbers and quality any previous display of this breed.

Signed by the executive committee.
JAMES MORTIMER,
JOSEPH B. THOMAS, JR.,
DR. J. E. DE MUNDT,
[The specials number 40, of which 6 are cups.]

New Publications.

Do Animals Think? By H. H. Recordon. Broadway Publishing Company.

This is the second edition of a work purporting to show "that animals think, some more and some less, according to their capabilities." It is a thin volume of 81 pages, given up to examples of rather extraordinary doings of animals. Some of the cases cited may be authentic, many of them are frankly clipped from the columns of the newspapers. There are not a few that are interesting.

Florida Fancies. By F. R. Swift. G. P. Putnam's Sons.
In an attractive and very prettily illustrated volume of 120 pages, Mr. Swift gives us his experience during a Florida trip and a short story of a trip to Cuba. Mr. Swift has a pleasant style and a ready sense of humor, of which, however, he is rather disposed to give us more than enough. He is a good traveler, however, tells his story pleasantly, and has written a book that is worth reading. Price, \$1.25.

The Magic Forest. By Stewart Edward White. Macmillan Company.

"The Magic Forest" is a fairy story, very interesting in its matter and very attractively produced. Mr. White's reputation has already been made, but this book is likely to add to it.

The story is as simple as possible; a nine-year old boy lost off a train going across the Continent, in the wilds of western Canada, is almost at once discovered by Indians traveling north and picked up by them, travels for four months in their company, and at the end of this time is restored to his parents.

The Indians which picked up Jimmy, the hero, were Ojibwas, and traveling through the trackless wilderness of the North, Jimmy had an opportunity to see much of nature and to share the ways of the primitive man. The forest through which they traveled is the magic forest, which gives the title to the book. Mr. White's happy faculty of describing outdoor things was never better shown than in this volume, which our readers ought to see.

The book is happily written throughout. It will not fail to interest the children, for whom it was intended, but many grown-ups will read it with pleasure and profit. Its charm lies in its truth to nature, and in its absolute simplicity. Dealing with Indian life in another way, it has much of the charm of Dr. Jenk's Jijib.

Summer and Fall in Western Alaska. By Claude Cane. Price, \$3.
Col. Cane, an Englishman, who came to this country in 1902 for the purpose of hunting big game in Alaska, has written a volume giving an account of the summer and autumn hunt of that year. The volume is not intended to be a guide book, but rather an aid to sportsmen who may find themselves in that part of the world. Col. Cane went across the continent by the Canadian Pacific to Seattle, thence to Alaska, where he devoted a number of months to hunting bears, the white sheep, and finally the big moose in the forest. He took with him a camera, and his volume is very fully illustrated with full-page plates from very good photographs.

The arms carried by Col. Cane were a .256 Männlicher-Schonauer and a 12-bore Paradox. The Männlicher did its work with split bullets extraordinarily well; the Paradox was unsatisfactory. Its balls were expected to expand, but they never did so, and, except for its use as a shotgun to fill the pot when ducks or grouse were plenty and meat scarce, it was not a useful arm. On the other hand, as Col. Cane says, for grouse a .22cal. rifle with very light cartridges would be even more useful than a shotgun.

Col. Cane was quite successful in his hunting, but when he returned to the coast he found that the new game law had been passed by Congress and was in operation, and thus had some trouble and delay in getting out all his heads—four white sheep and four moose heads, besides his bear skins.

The book is interesting to all big-game hunters, and the pictures exceedingly good. One must deprecate, however, the tendency so common among sportsmen to have themselves photographed standing by their game.

The volume is very pleasantly written.

Snipe and Woodcock. By L. H. De Visme Shaw.
The last volume of the "Fur, Feather and Fin" series, edited by Mr. Alfred E. T. Watson, and published by Longmans, Greene & Co., is devoted to snipe and woodcock, as above stated, and has also chapters on these birds in Ireland by Richard J. Ussher, and on cookery by Alexander Innes Shand.

The purpose of the series is to present monographs on the various English birds, beasts and fishes generally included under the head of game.

Snipe and woodcock of course are among the most interesting of game birds; and although the American snipe and the American woodcock are markedly different from the British birds of the same name, yet as to these species, the Old World and the New have enough in common to make American sportsmen glad to read of woodcock and snipe in Britain. Mr. Shaw gives much of the natural history of the birds, about which he writes very attractively. The snipe is treated alone, and is divided into two sections, the natural history of the snipe, and its shooting. In the same way the woodcock is treated as to its ways and some of its peculiarities of structure, while another chapter is given to its pursuit. The whole question of the woodcock's bill is gone over again, and very properly so, because, notwithstanding all that has been written on the subject, comparatively few people seem to understand its capabilities. Another familiar subject taken up is the way in which the woodcock carries its young, and this remains as yet unsettled, for while Mr. Shaw declares that the bird commonly carries its young in its feet, the testimony of Mr. Ussher would seem to indicate—on Miss Fairholmes' observations—that the bird she saw carried the young by holding it pressed against the breast with the bill.

ONE OF MR. YOUNG'S TARPON.

dian trappers and hunters, is now engaged in the undertaking, and his many years of patient research and study of the manners and life of this amphibious beast promise abundant returns. American tourists and sportsmen who have visited the Saguenay will remember how many of these great white cetaceans may be seen disporting themselves upon the surface of the St. Lawrence, near the mouth of the former mentioned river. They appear like shapeless masses of blubber as their arched backs show from time to time above the surface. They are doubtless attracted to the mouth of the Saguenay by the large number of salmon which enter the river throughout the season. As each porpoise is supposed to eat from one to three barrels of fish per day, it is comparatively easy to form some idea of the fearful ravages which they make among the salmon, the herring and the cod. They are largely gregarious, though they frequently hunt their prey in couples. Mr. McNab has often peered over the edge of an overhanging rock to watch them catching salmon at the mouth of a stream, and sometimes a long distance up a river where they follow their prey. They chase a salmon into a shallow and then approach it from either side. The salmon appears unable to move, as if paralyzed by fear. If he attempts to run from one of his pursuers he falls into the open mouth of the other. The porpoise is equally expert in fishing for the slippery eel. Mr. McNab opened one of these animals the other day and found more than forty eels in its stomach. To prevent their wriggling, and probably also to aid digestion, the porpoise cracks the skull of the eel between his teeth before swallowing it.

The porpoises are captured by being imprisoned at low tide on the shoals, over which they have journeyed when the tide was high, in pursuit of their prey. Hitherto the difficulty has been to find any barrier strong enough to retain such enormously heavy beasts, and so many of them together as are sometimes inclosed. Mr. McNab has made the interesting discovery that the enormous nets through which they often broke are not necessary to hold back the porpoises. They are unable to stand the slightest vibration in the water, and so all that the hunter now finds necessary is to fasten a long, thin pole like a fishing rod, to a stake in the mouth of the stream, the bay or the estuary within which it is desired to retain the porpoises. They remain to be stranded and killed upon the shallows rather than venture past the vibrating rod. This sensitivity is believed to have its seat in the ear of the animal, which has so small an opening that it might

inally found there, and their successors, the half-breeds and renegades, than from the blackmailing white people who have located in that vicinity and claim to represent its civilization. A persistent effort has been made by some of the authorities of the town of Lake Nebagamon to unjustly tax my property within it, and two or three years ago they assessed the brook trout in the waters upon my property and threatened legal proceedings to recover the tax. My attorneys promptly notified the township authorities that because the assessment was illegal the tax claimed would not be paid. The following year the Board of Assessors was changed, and it did not seek to enforce the previous assessment or make a new one. This year, I presume, the previous assessors or those of their kind, were elected, and the brook trout were again assessed, and a levy made upon some of my property in the township of Lake Nebagamon, under the tax claimed on the first assessment. My attorneys have been instructed to resist the illegal assessments and efforts to collect taxes thereunder, also to prosecute to the fullest extent of the law the parties guilty of malicious acts against my property.

"Through the expenditure of much time and money during the past twenty-four years, I have been able to save from destruction and preserve the wonderful natural beauties of a very large section of the territory on both sides of the Brule River, near its source. It is fortunate for those who come after us that their love of nature has caused a few people to undertake the preservation of forests and waters and the game and fish therein in certain sections of this country, and it is regrettable that such efforts are generally met with opposition and too often malicious persecution on the part of those who, but for their own acts, would be most benefited thereby. H. C. PIERCE."

For some years before his death, the late Fred Mather had charge of Mr. Pierce's Wisconsin preserves, which gives the readers of FOREST AND STREAM an especial interest in this beautiful region.

Troubles with tax assessors are not wholly unknown to the average millionaire, and too often the assessor regards the owner of large estates as a good subject for fining. In such cases the victim is likely to resist, as, of course, he ought to do.

Maskinonge.

NEW YORK, Dec. 20.—Editor Forest and Stream: Mr. W. B. Cabot's statement in FOREST AND STREAM for December 19 to the effect that maskinonge means big pike

Yachting.

Designing Competition.

\$225 In Prizes.

Two designing competitions have been given in FOREST AND STREAM. The first was for a 25ft. water-line cruiser; the second was for a 15ft. one-design class. Both competitions were very successful. The great interest taken in those competitions has prompted us to give a third one, open to amateurs and professionals. The prizes which will be given are as follows:

First prize—\$100.

Second prize—\$60.

Third prize—\$40.

Fourth prize—\$25, offered by Mr. Theodore Zerega for the best interior plan.

The designs are for a yacht conforming to the following conditions:

I. Centerboard cruiser, 40ft. l. w. l.

II. Boat must not draw over 6ft with centerboard up.

III. The lowest freeboard to covering board must be 3ft.

The design must be modern in every particular, without containing any extreme or abnormal features. The conditions have been made as simple as possible, that competitors might have all latitude and scope in working out their ideas. We wish to produce an able and comfortable cruising boat, one that shall have ample accommodation for two or three men living aboard for a period of several months, and one that can be easily managed at all times by two or three paid hands. The draft is restricted to 6ft. in order that the boat may have access to nearly all the desirable harbors, and may, thereby, widely increase her cruising field.

Drawings Required.

I. Sheer plan, scale $\frac{3}{4}$ in.=1ft.—showing center of buoyancy, center of lateral resistance and center of effort of both rigs.

II. Half breadth, scale $\frac{3}{4}$ in.=1ft.

III. Body plan, scale $\frac{3}{4}$ in.=1ft.

IV. Cabin plan, inboard profile and at least one cross section, scale $\frac{3}{4}$ in.=1ft.

V. Two sail plans, scale $\frac{1}{4}$ in.=1ft.; one as a yawl; one as a pole mast sloop.

In the case of the yawl rig the position and height of the mast and length of gaff are to be the same as in the cutter rig. Plans must show working topsail and size of light sails.

VI. All ballast outside on keel except amount necessary for trimming.

An outline specification must accompany each design. The drawings should be carefully made and lettered. All drawings should be on white paper or tracing cloth in black ink. No colored inks or pigments should be used. The designs must bear a non-de-plume only, and no indication must be given of the author. In a sealed envelope, however, the designer must inclose his own name and address, together with his non-de-plume. All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, not later than March 1, 1904. All drawings will be returned, but postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all of the designs.

Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, who passed upon the designs submitted for the 25ft. with great care, has again consented to judge the designs and make the awards.

At a dinner given for Sir Thomas Lipton, in London, he was presented with a silver tea service which was subscribed for by the people of the United States. At this dinner Sir Thomas remarked that he had written to the New York Y. C. in regard to another challenge. The letter in question was received by Secretary George A. Cormack, of the New York Y. C., on Saturday last. He said he could not make the letter public until it had been put before the club at its next meeting in February, but he did not consider it of any great importance.

Notes From the Lake Yachtsmen.

A VERY important decision has just been rendered by the special committee who were appointed at the last meeting of the Interlake Yachting Association for the purpose of investigating the merits and demerits of the 21ft. restricted cabin class of the Country Club of Detroit, Mich. Fresh water yachtsmen were much interested in the result of this committee's findings, whose appointment was brought about through the efforts of some of the delegates to have the I. L. Y. A. adopt the Country Club's 21-footers. The class has many supporters in Chicago and Detroit who believe it is a good one and are backing up their opinions with boats. It is really an outgrowth, or a modification, of the 21ft. class formerly in use in the Y. R. A. of Massachusetts, and originated two years ago at Chicago, through a trophy given the Columbia Y. C. by Sir Thomas Lipton. The object of the trophy was to promote inter association racing, and in

order to encourage this, Commodore Walker, of the Country Club, presented his club with a valuable trophy to be raced for by a 21ft. class conforming to the restrictions of the Columbia Club. Last spring two boats, the Taifu and the Inness were built and pitted against the Little Shamrock, who challenged under the flag of the Columbia Y. C. Her overwhelming victory is too recent to require further comment, but it accomplished a good purpose, in that it inspired the members of the Detroit organization to better efforts for the future, and at present four boats are under process of construction, with a possibility of that many more being added to the list in time for next summer's racing. Believing the general size and type of the class to be a good one it is not surprising that the members of the Country Club were desirous of having the I. L. Y. A. not only recognize but adopt it.

Consequently, when the association held its annual meeting at Toledo, December 5, it was not surprising to see a large delegation of Detroiters on hand fortified with facts and figures with which to demonstrate to the gentlemen that the class was a good one and why it should be adopted. They attended well prepared for any emergency, as some opposition was not entirely unexpected, but they were totally unprepared for the onslaught that was to follow, as subsequent events proved. After the regular business had been disposed of the subject of the adoption of the class by the association was presented by Dr. Jennings, of Detroit. At this juncture a lively discussion followed, lasting more than two hours, after which a special committee composed of the following was appointed by the chair: Dr. Jennings and J. A. Rathbone, of Detroit, and Joe Hepburn, of Toledo. The committee was instructed to ascertain if the 21ft. class of the Country Club of Detroit, according to the rules and restrictions governing its construction, would produce a healthy, wholesome, comfortable, and seaworthy type of boat. By seaworthy the association meant a boat capable of taking long cruises, and a stress of weather such as might be encountered during the trip, and with sufficient accommodations to stow cooking utensils, provisions, etc.

If, after careful investigation, the committee were convinced that the class was a desirable one and filled the requirements specified, it was authorized to recommend said class to the association, viz., the I. L. Y. A., for adoption, when a special meeting of the delegates would be called and final action would be taken in the matter. The interpretation of this meant the ultimate adoption of the class pending a favorable report of the committee. The final decision of this committee is best explained in the following which has been sent to the secretary, and will be acted on at a meeting to be held within two weeks: Inter Lake Yachting Association,

Gentlemen:—We, the undersigned, after due and careful consideration, recommend that the I. L. Y. A. adopt the 21ft. restricted cabin class of the Country Club of Detroit as a special class, and provide races for it at its annual regattas, believing that in so doing we are further advancing the best interests of yachting.

Very truly yours,

C. G. JENNINGS, M.D.,
J. A. RATHBONE,
JOE. HEPBURN.

Following closely upon the heels of the above resolution, comes the ensuing announcement from Detroit that two amendments, one of them very important, have just been made in the rules and restrictions of the Country Club 21ft. class in conjunction with the 21ft. class of the Lake Michigan Association. The first is entitled, "Overhangs," and reads: "Neither the after nor the forward overhang shall exceed 65 per cent. of the total overhang." This is to stop putting the overhang all on the forward end of the boat, as is likely to be done to get a finely drawn out forward section with an easy entrance. In one case of a design from which a yachtsman will build this year there were ten feet in the forward overhang and five in the after. This will have to be changed. It does not, however, affect those boats of the class already in existence, as there have been no extremes in either direction.

The second amendment is entitled, "Scantlings," and reads as follows: "The stem, stern post, keel, deadwood, frames and main deck beams, shall be of oak and solid. In the former rules no provision was made for stock, except in the keel where oak was specified, and this will insure the use of oak right through. Of course, although not specified, it was understood by all builders that oak was to be used in all of these cases, and it has been done in all boats now built. It is the intention of the Country Club and the Lake Michigan Association to act together in the matter of changing these rules, so important to both, as both are anxious to eliminate any possible opportunity of designers prescribing or substituting other than will produce a sound, strong, and thoroughly seaworthy boat.

The Detroit Y. C. now comes to the front with an announcement that it will be in the game next season with a pair of 21-footers, with which it intends to compete with the Country Club in its races for the Walker cup, and that the boats will also be sent to Chicago to enter into competition for the Lipton cup. In support of the movement the Detroit Y. C. has volunteered to defray the expenses of the faster of the two boats in making the trip to Chicago, but it is stated that should both boats show up well in the trial races and the races that are to follow, that both will be shipped up and entered in the series. One order has already been placed by a club member, H. T. Schmidt. Mr. Parker, of Marine City, Mich., a new man in the field, is the designer, and he will also build her. It is understood that she will be an improved Little Shamrock, and Mr. Schmidt expects her to be a hummer.

Another is expected to be built by a syndicate made up of club members, and two designers have submitted plans which are being seriously considered, and the announcement of a confirmation of an order of one or the other is expected at any time. It would not be surprising to hear of both being accepted, as both look well and the members are enthusiastic and spurred on by the recent action of the committee of the Interlake; both seem a possibility. This would mean three boats of the new class from the Detroit Y. C., four from the Country Club, and one that has already been ordered by Commodore J. H. Smedley, of the Detroit Boat Club Yachtsmen,

making a total of eight boats for the class out of three clubs in Detroit. This is indeed a favorable outlook, and should be encouraging to the supporters of the class, and especially to the Country Club, which was responsible for its origin on Lake Erie. This will even exceed Chicago's showing for the number of boats built, as in the two years the class has been in existence there less than that number have been built.

Yachtsmen are deeply grieved at the sudden demise of Mr. William Warren, of Detroit. It is not often that the death of a young man is so widely felt. Mr. Warren, besides being the executive head of the largest drug house in the world, and generally known in a business way in most countries of the world, also became widely known during the last season as a yachtsman. He was a member of the New York Y. C., the Detroit Boat Club Yachtsmen, the Country Club, the Detroit Y. C., and other yachting organizations, and as the owner of the famous 30-footer Cadillac was known from one end of the inland seas to the other. Two years ago he had been a member of a syndicate which built Canada's cup defender Cadillac. When the syndicate was disbanded he purchased the yacht, and she entered every important yacht race on fresh water during that year. He was not a sailor, but he had a genuine love for aquatic sports, and spent money liberally that they might be advanced in a sportsmanlike manner.

C. W. SCHMIDT, JR.

Boston Letter.

BOSTON, Dec. 21.—On account of protests which have been hanging since the close of the racing season, the Regatta Committee of the Boston Y. C. has been unable until now to give the percentages in the various classes for the season's championship and also for the midsummer series. The more serious protests were Sally VII. vs. Chewink, with counter protest, and Aspinquid II. vs. Chance. In each of these cases the evidence was conflicting and unvarying. On this account the committee was unable to get at the facts, and in both cases it was decided to allow the races to stand as sailed. In the 18-footers particularly there would have been a great difference in the championship and also in the midsummer series. Another protest was that of Perhaps II. vs. Mildred II., with counter protest by Mildred. Both were made on measurement. Upon measuring it was found that both yachts exceeded the required waterline length and were disqualified for the race, which was the last one of the season.

For the club championship two prizes were offered in each class by Commodore B. P. Cheney. The first prizes were silver cup and the second prizes binocular glasses. The championships were won by Sally VII., Opitsah V., Perhaps II., and Miss Modesty. In the following table of percentages, it is assumed that each yacht shall have started in at least six races:

Class D—25-footers.

	Starts.	Total Per Cent.	Average.
Sally VII., L. F. Percival.....	5	500	83.3
Chewink III., F. G. Macomber, Jr.....	8	575	71.8
Great Haste, T. K. Lothrop, Jr.....	5	275	45.8
Calypso, A. W. Chesterton.....	3	100	16.6
Early Dawn III., J. E. Doherty.....	1	75	12.5
Seboomook, B. A. Smith.....	1	25	4.1

Class E—22-footers.

Opitsah V., S. H. & H. I. Foster.....	8	733.4	91.6
Medric, H. H. White.....	8	383.3	47.9
Chief, S. C. Winsor.....	4	200	33.3

Class S—21-footers.

Perhaps II., J. E. Robinson.....	2	200	33.3
Mildred II., S. P. Moses.....	1	50	8.3

Class I—18-footers.

Miss Modesty, B. S. Permar.....	8	652.5	81.5
Demino, C. C. Clapp.....	9	721.1	80.1
Miladi II., F. R. Adams.....	6	478.8	79.8
Gertrude II., H. E. Lynch.....	6	434.4	72.4
Chance, Reginald Boardman.....	4	384.6	64.1
Mirage, J. W. Olmstead.....	8	421.5	52.6
Biza, Alfred Douglas.....	6	293.2	48.8
Humbug, Cole & Bacon.....	7	323.8	46.2
Yo San, R. J. Randolph, Jr.....	8	262.8	32.8
Crow, Hooper & Lauriat.....	5	153.8	25.6
Walada, W. W. Rowse.....	5	114.3	19
Wink, L. B. Goodspeed.....	3	111.6	18.6
Rattler.....	1	70	11.6
Nienack, E. B. Holmes.....	6	50.1	8.3

For the midsummer series of open races, which were instituted by the Hull-Massachusetts Y. C., and are now continued by the Boston Y. C., two prizes in each class were offered by Mr. Thomas W. Lawson, as in former years. These prizes were silver cups. The winners were Sally VII., Opitsah V., and Chance. In the 18ft. class Miss Modesty and Mirage were sold out of the club before the last race was sailed. The percentages for the three races are as follows:

Class D—25-footers.

	Total per c't.	Average.
Sally VII., L. F. Percival.....	300	100
Chewink III., F. G. Macomber, Jr.....	175	58.3
Great Haste, T. K. Lothrop, Jr.....	150	50

There seems to be every indication that the proposed new 30ft. class will be a success. Mr. A. A. Packard, of Messrs. Burgess & Packard, at whose offices most of the restrictions were made and an approximate model furnished, says that while only one yacht has been actually ordered, it is almost certain that three will be under way soon, and that the prospects are that at least three more will follow. Messrs. Burgess & Packard have an order for one of the 30-footers for Mr. T. K. Lothrop, Jr. They have also orders for an 18-footer for Mr. Her-

bert L. Bowden, a 22-footer for Mr. C. F. Holmes, a 15-footer and two small boats for Mr. A. P. Loring, a 30ft. launch for Mr. A. H. Chase, of Providence, a 22ft. cruiser for Mr. A. A. Bennett, of Chicago, and a new one-design of five or six boats for Osterville, Mass. They have also an order for a 21-footer for Mr. Kenneth Stevenson, of Detroit, to race for the Country Club cup. Mr. E. A. Boardman reports that the 18-footer for Mr. J. W. Olmstead has been finished by Shiverick, of Kingston. The 18-footer for Mr. R. de B. Boardman is set up at Fenton's, Manchester, and a 15-footer for Mr. C. K. Pevear has been laid down at the same shop.

JOHN B. KILLEEN.

Gasolene Engines for Marine Propulsion.

Read at the eleventh general meeting of the Society of Naval Architects and Marine Engineers, held in New York, Nov. 19 and 20, 1903.

BY D. H. COX, MEMBER.
(Concluded from page 494.)

The Dolphin, a small launch recently constructed, is a good example of the extreme development in this direction. Her lines are reproduced in Plate No. 6, and are most interesting, as is also the photograph, Plate No. 12, of her under way at full speed. The particulars of this launch are:

Length over all	25ft. oin.
Greatest beam	4ft. oin.
Power	7 H. P.
R.P.M.	720
Speed	12 miles

The engine is a two-cycle single cylinder, 5in. by 5in. The contour of hull in the fore-and-aft plane below water will be seen to be straight from the lowest point at the forefoot to the bottom of the transom aft, and the load water plane will be seen to be nearly triangular, the bow being the apex and the stern the base. The sections are also triangular below the waterline. The entire absence of broken water shown by this hull, either in the wake or alongside, when driven at the high speed, for its length, of 12 miles, is most remarkable, and the speed reached with the given power is also worthy of attention. It is stated that an extreme design not unlike this launch has been tried in some German torpedo vessels, and excellent speed results obtained, although as sea boats the type proved a failure.

The Express, another fast launch, is also shown in a photograph, Plate No. 13, and her lines are reproduced, Plate No. 7. She will be seen to be an approximation toward the extreme type as shown in the Dolphin, but the designer, not wishing a freak but a boat that would have great speed and be comfortable in Long Island Sound in any weather, modified his lines to a considerable extent and produced a not abnormal looking hull above the waterline at least, and a good handy boat for the conditions desired. Her particulars are:

Length over all	27ft. oin.
Beam extreme	4ft. oin.
Power rated	9 H. P.
Speed	12 knots

The motor is a four-cylinder four-cycle machine, and is said to develop about 10 H. P. The photograph shows the small wave disturbance caused by this hull also and her satisfactory absence of squat. It will be noticed, however, that there is considerably more broken water alongside than in the case of the more extreme Dolphin

now give the inclined water-lines of sailing vessels careful consideration, a fact that at one time was altogether neglected. That success has been met with is readily seen from the photographs and data accompanying this paper, and the effect so often seen in short launches driven at high speeds of the forefoot completely out of water and

Dolphin, 12 Miles an Hour.—Plate 12.

There are other launches built or building of extreme type that would make interesting subjects of study if their lines were available, but information of this sort is hard to obtain. The general trend of the speed launch design is to make the squat as little as possible by the full waterlines aft, and then to secure a proper entrance at the plane of flotation when under way instead of at rest in the water, much in the same manner as designers

a smother of foam under the bow is conspicuously absent. Unfortunately, in many instances the actual power developed by a gasolene engine of given size and rating is quite problematical, and hence it is hard to arrive at any accurate conclusion regarding the performance of a particular launch, and from it to draw conclusions regarding the probable effect of enlarging one of these models to a size suitable for, say, torpedo-boat work. It would

Express at 12 Knots an Hour.—Plate 13.

LINES, DECK PLAN AND OUTBOARD PROFILE OF 57-FOOT CRUISING LAUNCH.—DESIGNED BY SMALL BROS. FOR C. H. KELLEY. 1903.

seem, however, that experiments at the model basin with designs on some of the extreme types mentioned might lead to some interesting information for a class of extremely high speed torpedo vessels for harbor work only, as they certainly would not prove a success in a seaway.

The outlook for the continued increase in the use of the gasoline engine for marine work is, in my opinion, most promising, and more particularly in engines of considerable size. Up to the present, the lack of confidence in engines of this type has, for the most part, limited their use either to small launches or to vessels in which the power required was not great, and the installation of more than 100 horse-power in one hull has been quite an unusual event. With the confidence gained from experience with the improved marine engine, owners are now prepared to invest more money, feeling that they run but little risk of disappointment, and next season will see quite a fleet of power boats, from the hands of various designers, that will present many novel features, and with their high power and great accommodations will probably be very popular additions to the yachting fleet.

As an illustration of the saving in room effected, it may be stated that in a 75ft. steam launch of recent design, with water-tube boiler and four cylinder triple expansion engine of 175 H. P., the total length of boat given up to engine and boiler room was 18ft., the whole width of the boat as well over this length being taken up to provide for bunker space and auxiliaries. A 175 H. P. gasoline engine would require only an engine room of 12ft. by 5ft., saving 6ft. in length, and leaving considerable space available on each side of the engine room hatch. Owing to the absence of auxiliaries two engines of this size, or 350 H. P., could be installed in this launch in the same 12ft. of engine room. From the weight point of view one 175 H. P. gasoline engine would weigh about the same as the steam engine, thus saving the weight of boiler, piping, auxiliaries, and feed water, as the coal may be offset by the oil carried, the total saving being about 15,000 pounds, or 30 per cent. of the total displacement. Even with 350 H. P. there would still be a saving of about 10,000 pounds over the weight of the 175 H. P. steam engine.

Much assistance in the preparation of data for this paper was given by Mr. C. D. Mower, of the Rudder, who kindly loaned a number of cuts from that periodical, and supplied the information regarding certain of the launches.

The business of Messrs. Rice Bros., of East Boothbay, Maine, has been reorganized, and in the future will be known as the Rice Brothers' Company, with a capital of \$100,000, of which \$75,000 are paid in. The directors are Messrs. Henry W. Rice, William H. Rice and Frank L. Rice, of East Boothbay; George F. Gould, of Portland, and Fred K. Daggett, Boston.

57-Foot Cruising Launch.

We publish herewith the plans of a most interesting cruising launch. The design is from the board of Messrs. Small Brothers, and the boat will be built by George Dinsmore at Winthrop, Mass., for Mr. C. H. Kelley.

Her dimensions follow:

Length—	
Over all	57ft.
L. W. L.	53ft. 7¼in.
Overhang—	
Forward	1ft. 6¾in.
Aft	1ft. 10 in.
Freeboard—	
Bow	4ft. 8 in.
Stern	3ft.
Least	2ft. 9½in.
Breadth—	
Extreme	10ft.
L. W. L.	9ft. 4 in.
Draft—	
To rabbet	1ft. 9½in.
Extreme	3ft. 3 in.

The yacht will be equipped with a Jager 35 horse-power four-cycle, four-cylinder engine, which will give her a speed of about 14 knots.

The design shows a comfortable little vessel with good lines. She ought to be a good sea boat and be comfortable in bad weather. The boat should prove an admirable cruising craft, for the design is suitable for open water, and the cabin arrangement is splendid and should give the greatest amount of comfort to those living aboard.

Power boats of this size are the most popular for cruising, still the question of keeping the crew away from the owner and his guests has always been a problem. In these vessels the designers have overcome this obstacle in a very ingenious way.

The engine room is well aft and away from the other quarters, and there is a separate entrance for the engineer on the port side. The engine room is very light and roomy, and on either side under the deck there are bunks for the engineer and his assistant, if one is carried, or for the crew.

On the starboard side of the engine room is a companionway for the owner and his guests. This leads to a steerage. On the port side of the steerage a door gives access to the galley, which is quite roomy and is completely fitted with all modern requirements and conveniences. On the starboard side of the steerage is the toilet room, which is equipped with a patent closet and a set wash basin.

Next forward there are two cabins, both of which are 6ft. 6in. long and extend the full width of the boat. On each side there are wide transoms, which can easily

be made into comfortable beds, and these cabins can be shut off and made absolutely independent of one another.

The pilot house is next forward and is 6ft. 5in. long. The floor is raised, and the man at the wheel has an unobstructed view on all four sides.

There is no need to pass through the cabin to get to the pilot house, the latter being narrowed in so that there is an entrance from the deck.

The forecabin is quite roomy, and there is 4ft. 6in. headroom under the deck beams.

The forward deck is 12ft. long and the after deck 13ft. 6in. long. The cabin house is only 3ft. high, and an 11ft. dinghy is carried on the davits.

Just aft of the pilot house is a bridge, from which point the boat can also be steered.

Notes on Yacht Measurement.

Editor *Forest and Stream*:

I have read with a great deal of interest the very excellent article on yacht measurement, by Dr. Poor, printed in a recent issue of your paper.

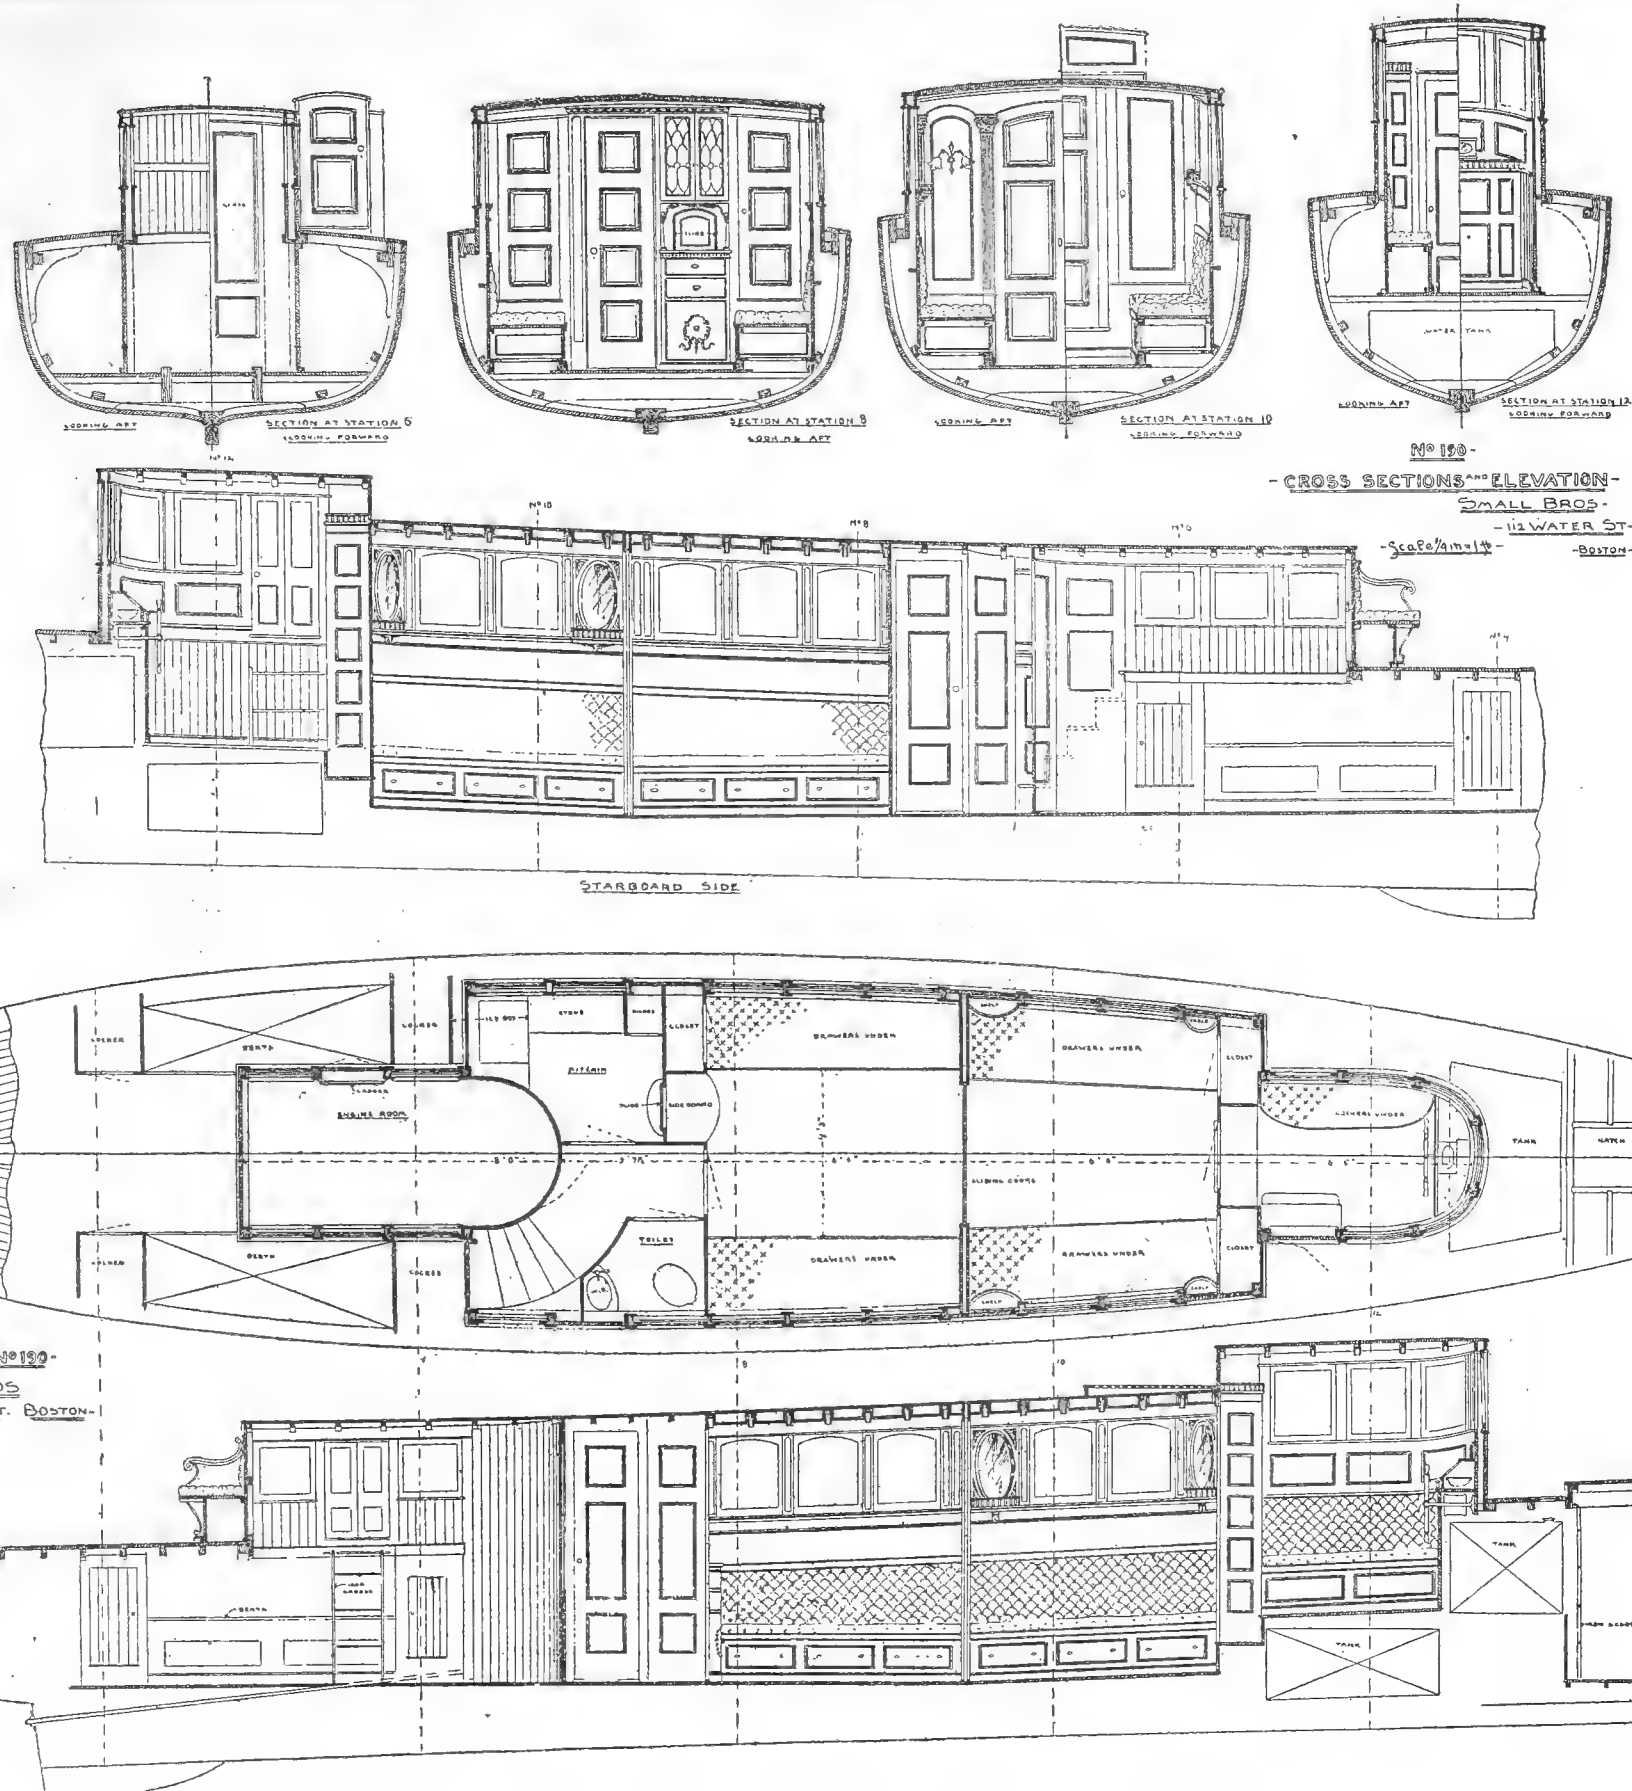

It is certainly a very valuable contribution to yacht measurement literature, and must attract the attention of all who are interested in the establishment of an equitable and fair method of measurement for the rating and classification of racing yachts.

The effort made to arrive at the value of sail area and to determine its true relation to speed, appeals to me very strongly, and, although, many differ from him in his deductions, they cannot but approve of his method of handling the subject.

It seems to me that his article is on the right lines and should be productive of good results in bringing about a general discussion of the proper factors and their relative and respective values in any rule that may be generally accepted.

In the consideration of these factors, taking up the question of sail area and its relation to speed, the use of square root or fourth root of sail area having been so ably treated in Mr. Phillips' reply, I shall not further discuss this branch of the subject, but proceed to a consideration of the value of sail area in whatever way it may be taken as affecting the speed of sailing vessels. I think it will have to be conceded that the independent value of sail area depends almost wholly upon the force or strength of the wind. That at times it is a benefit and at other times a handicap, and that the amount of sail that a boat can carry to advantage is a problem wholly for the designer to solve, and depends entirely upon conditions differing in different localities.

I am quite sure that the experiment suggested by Dr. Poor of taking three of the Newport thirties and increasing the rig of one, reducing the rig of another

INBOARD PROFILE, CABIN AND SECTIONAL PLANS OF 57-FOOT CRUISING LAUNCH.—DESIGNED BY SMALL BROS., FOR C. H. KELLEY. 1903.

and retaining the rig of the third, as it is at present, if successive trials were had in light, strong and heavy winds, that the boat with the largest rig would win in light winds, the one with the moderate rig in strong winds and the one with the smallest rig in heavy weather.

I am afraid that one would experience great difficulty in arriving at any accurate determination from the results in these trials, as to the exact value of a square foot of sail area as an independent speed factor, and that it might be found logical to fix its value in a minus quantity in some of the races that might be sailed by these boats.

I can confidently state as an owner of a Newport thirty for several years, from my experience in racing in my own boat, and in others of the same class, that any considerable increase or reduction in the sail area would be detrimental to the chances of winning a majority of the races sailed at Newport, and that no value could be correctly put upon sail area as a factor of speed independently of the other necessary factors of a rating formula.

The conclusion that the value of sail area cannot be taken by itself as a speed factor, brings us to the consideration of its true relation to speed and to its proper function in a rating formula.

Accepting the principle that within economic limits opportunities for speed vary in different vessels as the square roots of their respective lengths, we find that length alone without beam or depth is without power to carry sail or support any propelling force, and that with length it is necessary to have both beam and depth to utilize any power to produce speed. As we increase depth or beam or both, we increase the power and the ability to carry sail.

With the increase of power to carry sail, we increase the resistance by the increase of the bulk to be driven, and on a fixed length we find that within reasonable limitations the increase in the power to carry sail in order to maintain the same speed for the length, compels an increase in the driving power to overcome the increased resistance.

It would seem natural, therefore, to conclude that sail area or propelling force has only relation to the bulk or power to carry sail, and the resistance to be overcome.

Taking length as the index of speed and propelling force in proportion to bulk or differently expressed, sail area in proportion to displacement, I take it, we reach the true relation of sail area to speed and give it a proper place in rating measurement.

A formula with length as the factor of speed, and with an allotment of sail area to displacement, would seem to bring us to the true principle, which should be the foundation of any just rule.

While it is perfectly true that power can be obtained

by using draft or beam, or draft and beam on a reduced displacement, the reduction in the allotment of sail for the reduced displacement eliminates any undue advantage of this method of getting increased sail carrying power, and at the same time a reduction of the resistance.

The temptation to cut the displacement unduly is removed with a rule allotting sail area to displacement, and while the premium of additional sail area is given to increased displacement, the naval architect is left free to design a boat of a fixed length, of large displacement and a sail area proportionate to this displacement or a boat of small displacement with a restricted sail area in proportion to the reduced displacement, or vary the length, displacement or sail area in any proportions that may be deemed advisable, depending on the type of the boat desired, limited only by the total sum of the factors taken figured together according to the rating formula.

The rule, heretofore, in general use of $\frac{L + S.A.}{2}$ in which the length taken is the L. W. L. and the sail area is limited only by the length of the L. W. L. taken, has resulted in the building of boats with excessively long and full overhangs, in which the L. W. L. does not represent at all the actual length of the boat, and in the reduction of the displacement to the extreme limit so as to obtain the power to carry sail with the least resistance.

The natural result has been that the boats built under this rule have been substantially of one type, none others having the least chance of winning, and spoon bows, shoal bodies and deep fin keels have been evolved, one extreme following another, until it became necessary to build a machine to take any successful part in the racing.

In order to check the evasion of the length and sail area rule, girth rule was adopted by the Y. R. A. of Great Britain, and an effort made in that way to compel the taking of more displacement and a fuller midship section. The effect has been beneficial in promoting a better type of vessel, but not entirely successful in accomplishing satisfactory results.

With the same purpose in view, the Larchmont Y. C. and the Long Island Sound Y. R. A. have added to the rule penalties for excessively full waterlines and for lack of area in the midship section.

The effect of these limitations would seem to have been to hamper and control design and to simply promote the evasion of the restrictions. At best such a modification of the length and sail area rule must prove but a temporary make-shift and be superseded by a rule in which the proper relations of the factors of speed are established in a rating formula.

To the New York Y. C. belongs the credit of taking the initiative in a movement to better the existing con-

ditions and to determine the principles upon which the measurement and classification of yachts should be based.

The acceptance by that club of the report of a committee appointed to obtain the views of prominent designers and the adoption of a rule of measurement recommended, in which the factors of length, sail area and displacement are combined in a rating formula, makes the eventual establishment of a uniform system of measurement a matter certain of accomplishment.

The length in the old rule of L. W. L. has been discarded, and in its place a measurement of length taken at the quarter beam, which approximates the sailing length of the hull.

The sail area is the actual measured area of the sails. The principle of the allotment of sail to displacement or to length and displacement is embodied in the use of the displacement in the denominator of the formula.

If experience shall demonstrate that the exact relations established need modification, that the premium on displacement has been put too high, that the tax on sail has been fixed too low, that the advantage of length may not have been given sufficient importance, that the methods of measuring can be simplified, as these features are all matters of detail, they can be adjusted as experience may suggest.

There are no complications involved in the rule and no measurements or calculations required which cannot be made by anyone of ordinary intelligence or schooled in the simplest problems of mathematics.

That the rule will produce a more wholesome type of vessel to be developed under its influence, and that its adoption will admit of the building of such a type is certain, and also that such vessels will be rated by it in a way that will place them upon an equality in the matter of speed for rating with the machines evolved under the old rating.

The one other point to which attention should be called is the relation of displacement to light construction. In considering this relation it will be found that the premium on displacement minimizes to a very great extent the advantages heretofore obtained by the designer availing himself of the extreme possibilities of light construction and the dangerous saving of weight in the hulls, and that it also does away to a very great extent with the necessity for the adoption of any scantling rule or table of restrictions with respect to fittings or outfit.

In concluding what I have to say on this subject so important to the future development of yachting, I feel compelled to dissent from Dr. Poor's statement that "no consistent attempt has been made to study the scientific principles involved in the problem."

With the writings of such eminent authorities as Benson, Kemp, Bucknall, Kroman, Froude, with the suc-

cessive reports of the yacht racing associations of Great Britain and with the very learned and elaborate articles of other English, German, Danish and French writers, I cannot but think that the subject has received scientific treatment; in fact, I believe a perusal and careful study of the records of the last measurement committee of the New York Y. C. will convince anyone that a consistent attempt has been made by that club to arrive at the scientific principles involved in the problem and that the work of that committee has resulted in the formulating of a rule that is founded on correct principles.

N. D. LAWTON.

NEW YORK CITY, Dec. 21.

Editor Forest and Stream:

In compliance with your request, I send some comments on the interesting article of Mr. Charles Lane Poor on yacht measurement in FOREST AND STREAM of Nov. 21.

It is a convincing exposition of some of the fundamental fallacies of the current type of rules. There is little novelty in the substance of Mr. Poor's criticisms; but they are notably clear and are valuable. He has developed more fully than anyone else in these columns the inadequacy of the tax on S. A., and the incongruity of basing time allowances upon the theorem that speed varies as the \sqrt{L} , and calculating them upon the as-

sumption that the $\sqrt{L} = \sqrt{\frac{L + \sqrt{S.A.}}{3 \sqrt{D}}}$.

or some other term manufactured in like manner. But he does not see that whenever S. A. has been appropriately taxed in proportion to its effect on speed, any other term is not needed in a rating formula.

He points out that there is nothing to warrant the assumption of the N. Y. Rule that speed varies inversely as the \sqrt{D} ; but he fails to perceive that the rule would be improved for measuring purposes by leaving out the factor D.

And he has overlooked the important error of the N. Y. Rule, and all other rules of that type; viz., that they undertake to combine in one formula two independent and incompatible functions: the rating of yachts for time allowance, and the control of form. The term \sqrt{D} was put into the N. Y. Rule as a divisor, not because the authors of that rule believed that speed varies inversely as the square root of the \sqrt{D} ; but because they knew that this factor would tend to encourage the building of yachts of larger displacement, which is desirable, and because they guessed that allowances for \sqrt{D} would be about right to produce the kind of underwater body desired.

It is this futile attempt to kill two birds with one stone, though the birds are not in range, which makes the current rules illogical absurdities, and failures in controlling design within desired limits. The finest curio among formulae of this kind is that of the Seawanhaka Club; viz., $RL = \frac{1}{2} L. W. L. + \frac{1}{2} \sqrt{S.A.} + (B + B') - B'' + (B'' + D_1 + 2.5 D_2 + D_3) - 3 \sqrt{3} \sqrt{VMS}$. So far as we are informed, time allowances are figured upon the assumption that speed varies as the square root of this combination.

The guarded proposition found in sundry yacht club books that "within economic limits opportunities for speed vary in different vessels as the square roots of their respective lengths" has been a fruitful source of confusion, which its terms do not seem to warrant.

Mr. Poor takes this to mean that "under normal conditions" the \sqrt{L} may be taken as a vessel's speed in knots, and apparently he thinks this is true without reference to the amount of motive power. For later he says: "The fact that the larger hull can be driven faster by the same power has been demonstrated time and again."

If it has the meaning Mr. Poor gives it, the theorem does not accord with facts; and it has long been misused by all yacht clubs. For example, in 1887, the Seawanhaka club book, after reciting the theorem, gives a table wherein the allowances are only 40 per cent. of those which would be required if $\sqrt{L} = \text{speed}$. In 1889 50 per cent. was given. The Herreshoff tables, in use by the New England Y. R. A. in 1888, gave about 52 per cent.; and now, according to Mr. Poor, the N. Y. Club gives 80 per cent. of the allowances that would be due if $\text{speed} = \sqrt{L}$. In a recent elementary textbook of naval architecture by E. L. Attwood, the author says: "That in full-sized ships driven at a moderate economical speed" the $\text{speed} = .5 \text{ to } 6.5 \sqrt{L}$; for mail steamers and battleships, .7 to 1 \sqrt{L} ; for cruisers, 1 to 1.3 \sqrt{L} ; and for torpedo boats, 1.9 to 2.3 \sqrt{L} .

Froude's law provides that, "In comparing similar ships or ships with models, the speed must be proportional to the square root of their linear dimensions." That is to say, taking Mr. Poor's example, if a yacht 36ft. long has a speed of, say 6 knots, the corresponding speed of a similar yacht (having sufficient sail) 100ft.

long, would be $\sqrt{\frac{100}{36}} = 1.66$ times 6 knots = 10 knots. In other words, the rule fixes the ratio of the speeds, but does not determine the absolute speed of either yacht. This, the writer understands, is the meaning of the theorem that is used as a basis for time allowance tables.

Froude's law also provides that the resistances of two similar vessels at their corresponding speeds will be as the cube of their linear ratio: Thus, in the above example, the 100ft. yacht at 10 knots would have $(2.8)^3 = 21.95$ times the resistance of the 36-footer at 6 knots, and would need increased sail in the same proportion.

Mr. Poor maintains that length is a factor in "producing speed," and he alleges that "the fact that the larger hull can be driven faster by the same power has been demonstrated time and again."

This last statement needs considerable qualification. It is not true of vessels driven at ordinary speeds, or of sailing yachts at the speeds which they can attain by their own sail. In general, increase of length (motive power being constant), decreases speed by increasing skin friction. The wave-making resistance of long vessels at high speeds is less than that of short ones; and at certain very high speeds, when the resistance from wave-making is considerably larger than the skin friction, a long vessel might save enough in wave-

SPIDER.

Designed and built by the Herreshoff Mfg. Co. Owned by E. M. Stone.
Photo by N. L. Stebbins, Boston.

making resistance to more than offset her increased skin friction over a shorter vessel. In such case her total resistance would be less than that of the shorter vessel. But these cases are not found in the racing of sailing yachts. According to theory, for moderate speeds, the resistance varies (1) as the immersed surface which varies as L^2 , and (2) as the square of the speed, which varies as L ; so that as noted above, theoretically, the resistance of two similar vessels of different lengths at different speeds will be proportional to the cube of their linear ratios. And Mr. Froude found this to be true by experiments.

The singular results obtained by him at high speeds in towing models having long parallel middle bodies, have no bearing upon the question of rating rules for yacht racing.

That L or D or B cannot "produce" speed must be obvious to anyone who will stop a moment for reflection. They may all modify speed by modifying resistance. The only factor which can produce speed manifestly is motive power—sail. When the whole of S.A. has been taxed nothing remains for legitimate taxation, because nothing else produces speed, or alone measures speed. If S. A. were kept constant, all the factors which make up resistance would together be a measure of speed; and they might be used for that purpose if their proportional influence could be ascertained and expressed in figures; but it cannot. Nothing is gained by attempting to use fractions of more than one measure. A yard stick is a complete measure; and using parts of two or more, adds nothing to the accuracy of a measurement, and is more inconvenient.

Negative speed factors, like D and B, should not be introduced into speed formulae by way of rewarding hindrance to speed, because a rating rule for racing yachts should tend to encourage the development of speed, and should be designed only to calculate the handicap which a yacht should suffer by reason of having an excess of motive power. In other words, there should be no penalty upon the skill of the designer. From a racing point of view the best designer is the one who can get the most speed with a given motive power.

The fact that it may be necessary or expedient to impose certain restrictions upon design and construction, in order to have safe and desirable racing yachts, has no more to do with the logic of the rules for handicapping purposes than the fact that it may also be expedient to require certain small boats, life buoys and anchors to be carried during races. Such matters can be attended to without interfering with the rating formulae.

Notwithstanding the unsoundness of the assumptions concerning the relations of the formula factors to speed, upon which the current type of rules is based, their failure as handicapping rules is not of great moment, because, in order to escape the results of these defects, yachts are largely built up to the limit of their class, so that the allowances are small in amount. The abolishing of time allowances would probably be advantageous. It is in its function of restricting the building of freak yachts, and of encouraging the building of good, seaworthy yachts that the rules fail completely. And could any other result be rightfully expected? Suppose any yachtsman or engineer were given a commission to make a regulation to prevent the building of light displacement yachts without reference to any other consideration. Is it conceivable that he would look up the regulations governing handicapping, and try to work them over into a form which

would also serve the purposes of his problem, and yet not injure their efficiency for handicapping? Or would he be likely to state in plain terms the minimum displacement in proportion to length, permissible for any yacht, with suitable restrictions as to its distribution in respect to height and width?

There is no good reason why the two matters of measurement for time allowance and restrictions on design cannot be treated separately, and the advantages of considering each by itself are evident.

What will be the result of attempting to regulate the matter of displacement by putting the $\sqrt{V D}$ into the measurement formula as a divisor? First, it will injure the rule as a measuring device. Second, it will necessitate years of experimental designing, building and racing of yachts at large expense to discover what amount and arrangement of displacement will give a yacht the best combination of speed and time allowance under this formula. And the chances are a thousand to one that the successful form will be found to have either more or less displacement than is desirable, or will have it distributed in an awkward form of hull. Worst of all, no advance will have been made in the matter of measurement, and no commensurate improvement in designing.

The genius and skill of yacht architects should be devoted to the discovery of forms of least resistance instead of to the engineering problem of carrying the largest sail on the frailest hull with the smallest and lightest spars and rigging; or to the problem of devising the best means to "beat the rule."

SEXTANT.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

There was a report current last week to the effect that the gasoline yacht Roamer, owned by Mr. H. C. Roome, had been lost on Rum Bay in the Bahamas. When an attempt was made to verify the report, it was found that the yacht that was wrecked was not Mr. Roome's Roamer, but a schooner of the same name owned by a Colonel Campbell, which boat sailed from Jacksonville over two weeks ago. She was built in Beaufort, N. C., in 1899, and was 77ft. over all, 66ft. on the waterline, 26ft. beam, 4ft. deep and 5ft. draft. She was 55 tons, and was formerly owned by Mr. C. E. Whitehurst, of Baltimore.

There are building at Mr. Willard F. Downs' yard at Bayshore, L. I., three one-design boats from designs made by Mr. Henry J. Gielow. The boats are 26ft. 8in. over all, 17ft. waterline, 7ft. 6in. breadth and 2ft. draft. There are 1,000 pounds of outside ballast on their keels, and the boats will carry 424 sq. ft. of sail in their mainsails and jibs. The boats are to be delivered complete to their owners on May 15, 1904. It is very likely that several more boats will be built from the same design.

The South Coast Y. C. will soon have a \$15,000 club house built at San Pedro, Cal.

Mr. Edson B. Schock has opened a brokerage department in connection with his regular business as naval architect. Mr. Schock was formerly with Mr. A. Cary Smith, and also had charge of the construction of the Holland torpedo boats and the U. S. cruiser

Chattanooga, which vessels were built at the Crescent Shipyard, Elizabethport, N. J. Among the yachts turned out this winter by Mr. Schock are the following: 50ft. launch for Mr. Wm. E. C. Mayer, of Brooklyn; 36ft. launch for Mr. E. H. Foss, of Bay City, Mich.; 43ft. steam launch for Mr. E. M. Fulton, of Annapolis, Md.; 30ft. catboat for Mr. C. Shearer, of New York City; 28ft. catboat for Mr. Wm. F. Zimmerman, of New York city, and a 36ft. sloop for Mr. Alex Rennick, Philadelphia, Pa.

Mr. Joseph Fellows, of Los Angeles, Cal., is building a racing sloop for Mr. Walter Folsom, and a 40ft cruising yawl for a gentleman whose name is withheld for the present.

A dinner was given to Mr. Wilson Marshall, owner of the new auxiliary schooner Atlantic, by his friends at Rector's, on Saturday night, Dec. 19. Mr. Marshall was presented with a loving cup.

The regular meeting of the Old Mill Y. C. was held at the club house on Sunday afternoon, Dec. 13, and the following officers were elected: Com., John May; Vice-Com., C. Mehrkens; Rear-Com., C. W. Cooper; Rec. Sec., George Buehler; Cor. Sec., E. Ferry, and Treas., Harry Walker. The report of the Board of Trustees showed a very healthy condition of the financial affairs of the club. The club has grown to such an extent during the past three or four years that it is absolutely necessary to make an addition to the quarters on Jamaica Bay, and as soon as the weather permits work in the extension will begin with a view to having the improved home ready when the club goes in commission in the spring.

The Jamaica Bay Y. R. A. is exploiting a one-design class of shallow draft 18-footers, and several members of the Old Mill Y. C. have agreed to build in this class.

Ruffhouse, the house-boat built by the Nilson Yacht Building Co., of Ferry Bar, Baltimore, Md., from designs by Messrs. Sadler, Perkins and Field, for Mr. A. R. Whitney, of Morristown, left Baltimore on Dec. 19 for Florida by the inside route. The plans of this boat appeared in FOREST AND STREAM Nov. 21.

The auxiliary Aloha, owned by Com. A. Curtiss James, reached New York on Dec. 19, twenty-five days out from Falmouth, England. The yacht returned by the southern route, and she had good weather until she reached Bermuda. From the time Aloha left Bermuda strong N. W. gales were encountered. Aloha has been making an extended cruise in foreign waters, and while she was away she figured in two collisions. On the night of Sept. 17 she lost her lower fore yard when in collision with a fishing vessel off May Island. She put into Leith the day following. On Oct. 28 Aloha reached Falmouth with her bowsprit and head gear carried away. This time she had been in collision with the British tramp steamer Zoroaster.

The second annual dinner of the Red Bank Y. C. was given at Delmonico's on Saturday night, Dec. 19. Over 100 members and their guests were present.

A venturesome old salt living in New Zealand has built a yawl, intending to sail in her with one other hand to London, via Cape Horn, and afterward to the St. Louis exhibition.

The boat is much after the style of a ship's lifeboat, with more rise of floor and freeboard, and with a keel running from nothing forward to close on 2ft. at the heel. The boat is built of kauri, with three skins—two diagonal and the third and outer fore and aft. Her dimensions are: Length, over all, 22ft.; beam, 6ft. 6in.; draft, 3ft. 6in. Ballast consists of 4cwt. of shingle inside and 7½ cwt. of lead on the keel, but she has also four tanks, holding 128 gallons of fresh water, placed low down on the keel, and it is the intention, as these are emptied, to refill with the briny. She has a small raised cabin top with sliding companion and a water tight self-draining cockpit lined with zinc. A pipe with stopcock connects this cockpit with the tanks, so that by shutting off drain pipes any fresh water caught in the cockpit during a heavy rain can be run into tanks. She is rigged as a pole-masted yawl with jib-headed mizzen. Mast, 21ft. over all, 12ft. hoist; beam, 12ft. 6in.; gaff, 10ft.; mizzen boom, 5ft.; no bowsprit. There is nothing special about the rigging in the way of reefing gear, but everything is good and sound.—Brooklyn Eagle.

Tarantula, the turbine yacht owned by Mr. W. K. Vanderbilt, is at Tebo's, South Brooklyn, where she will receive a general overhauling. The forward center turbine will be removed and numerous other changes will be made in her machinery.

Mr. T. Jenkins Haines, the well-known writer of sea stories and author of "Wind Jammers," "The Strife of the Sea" and "The Wreck of the Conemaugh," with his wife and the crew, was rescued from his yacht Edna by schooner William G. Tanner. Edna left Ocracoke, N. C., on Dec. 7 for Florida. On the afternoon of Dec. 9 she was struck by a heavy gale and was blown several hundred miles off her course. Thrashing around in the heavy seas caused her rigging to part and considerable water found its way below. On Dec. 11 the bowsprit was snapped off at the stem head, and on the day following, Dec. 12, the rudder was carried away. The yacht became unmanageable and an ensign was hoisted at half mast. The signal of distress was seen by Captain Johnson, of the schooner William C. Tanner, and he ran down and passed a line to the unseaworthy yacht. The owner and his wife, together with the crew, were taken aboard the schooner, and

THE NAUTILUS, R. C. C. SAILING CANOE FITTED FOR CRUISING.

some few things were saved from the yacht. Edna was abandoned after an unsuccessful effort to tow her had been made. Edna was built by Geo. Lawley in South Boston, a number of years ago.

Canoeing

Cruising Competition Awards

WHEN we say that canoeists are apathetic and indifferent to the papers that devote space to their favorite pastime, we speak advisedly, and this has been a source of regret, not to say disappointment, to us. Our columns have been open to canoeists for the past thirty years, but only a few enthusiasts have taken advantage of this; yet it is only through the medium of the papers that sportsmen can keep in touch with one another.

It was with some misgiving that we gave out the canoeing competition, for we were uncertain as to what sort of a reception it would receive, and it was an open question whether it would be properly supported. However, the results prove that we were on the right track. The competition seemed to infuse new life among canoeists, and we hope that it will prove to be a stimulus, to revive and awaken new interest in FOREST AND STREAM as a canoeing paper. We hope that we are on the eve of a new era, and that canoeists, both individually and collectively, will accord us the hearty support that we have given them in the past.

The stories submitted in the competition were numerous, and the cruising grounds were varied and well scattered. If any general criticism were made, it might be that not enough attention was paid to practical hints while en route. We wish to lay particular stress on this point, for while in almost every instance a list of supplies was given, the logs were sadly lacking in pilotage notes and suggestions.

The photographs sent in with the stories were not all that might be wished. Those sent in by L. O. Armstrong, who won the fifth prize, are really superb. Solio prints, with a glossy surface, give good results in making half-tones, and competitors in the future should bear this fact in mind.

To "Hector and Me," by Mr. C. S. Howard, of Toronto, Canada, was awarded first prize of fifty dollars.

The second prize goes to one of the oldest and best known writers on canoeing subjects in this country, Mr. Perry D. Fraser, of St. Louis, Mo. His cruise was entitled, "The Nomads on the Osage."

"The Cruise of the Red and the Green," by Arthur L. Wheeler, Bryn Mawr, Pa., third prize.

"The '03 Log of the Frankie," by F. R. Webb, of Staunton, Va., fourth prize.

"Mississaga Canoe Trip," by L. O. Armstrong, of Montreal, Canada, fifth prize.

"The Log of the Iris," by J. M. Stalker, Detroit, Mich., sixth prize.

"Canoe Cruising in Canada," by R. W. Ashcroft, New York City, seventh prize.

"A Canoe Cruise," by William H. L'Estrange, of Duluth, Mich., eighth prize.

Among the others sent in the following are particularly deserving of honorable mention:

"The Allegash Canoe Trip," G. Harry Sperry, Brookline, Mass.

"Canoeing on the Delaware River," William Ellery Tufts, Bath Beach, N. Y.

"A 350 Mile Canoe Trip," J. Philip Wahlmean, New York city.

"In Canoe and Camp," C. E. Noxon, Rochester, N. Y.

The Canoe Tent of the Nautilus Sailing Canoe.

From the London Field.

CANOE tents, at least such as have proved successful, have varied very little in design during the last twenty years; peculiar formations have occasionally been brought out, but never seen again, having failed when put to actual test. Probably the wall-sided tent with sloping roof is the most popular; but it is not so much in relation to general design as it is to detail that a tent is successful or the reverse.

One dominating requirement in a canoe tent, which is to be used on the canoe afloat, is that of convenience of stowage and lightness of structure. There must be no long poles about it, any stiffening spars or stretchers must be withdrawable, so that the tent itself may be packed or folded into the smallest possible package, and no spar be longer than can be stowed up under the side deck in the well; but, preferably, such spreaders should be stowable via the fore hatch into the forward compartment. Another point in favor of stowing in the forehold is that the tent is more likely to be kept dry, a very important state so long as it can be maintained. A saturated tent will be clammy and steamy inside all night, and will convey its dampness to everything exposed, including the man. A dry tent set up properly will, on a wet night, so shoot the rain as to remain practically dry on the inside all night; but with the doors, to be afterward described, much of the discomfort of a wet, clammy tent can be obviated, and the steam from the kettle carried off.

The leading requirements for a canoe tent for use afloat are as follows: (1) It should, when fully set up, give sufficient width and head room for the skipper to change all his clothes; and then be reefable for a bad night, to a mere slanting roof, so as to avoid the danger and discomfort of considerable surfaces exposed to wind and rain. (2) The tent should be of such nature in shape and substance of stuff that, when set up, it is practically rainproof; and the details of eyelet holes for spreaders, and of lashings, must be looked to to prevent the admission of wet. (3) The mode of setting up must be such as can be operated afloat from inside the tent, especially as to rapidly striking tent should a sudden night shift have to be made. (4) Entry or exit should be obtainable on either side not at the ends, and yet the doors should be closable as nearly wind and rain tight as possible. (5) The standing of the tent must be quite independent of the mast and spars; and the tent in no way attached to any of the sailing gear. On a very wet night it is no harm, indeed, it is a great comfort, to spread a light fly sheet over the lowered mast and spars, first fetching, say, half way down the walls with a lanyard or two to the deck edge; it not only shoots the rain, but it very much deadens the unpleasant noise of the rain patter which occurs on the well stretched roof when left exposed. (6) The ventilation of the tent must be independent of the side doors, and yet not admit rain. In dry weather there will be always more than enough ventilation blowing in all round the deck edges of the tent; but in wet weather the foot curtain, being wet, will pretty well stick to the deck; then a window, if not two, will be wanted.

So much for the qualifications of the tent. Now for safety, comfort, and quietness at night the mast ought to be lowered, but every bit of sailing gear should still be in such a position, and free of any tent ties, as to be immediately set up without waiting to strike the tent. It will be seen by the drawing that by pulling on the fore stay tackle the mast could be set up, and

held up, and the roller foresail could be used to shift berth, a cross yoke being put on the rudder head instead of the tiller, the hoisting, staying and sail setting can be done inside the tent, and the anchor tripped up to the stem, as all the ropes lead in under the fore end of the tent to the cleats at fore end of the well, and the side doors would be used for look out and working, perhaps for paddling. Of course this would only be done in moderate weather, but it might be raining hard, in which case it would be a great comfort not to get the well and gear wet in the middle of the night. As those know who have done much canoe camping on lakes or estuaries, a night shift of berth is by no means an uncommon occurrence; the snug berth under the lee of an island on a large loch enjoyed during the evening in quiet, may in the early hours of morning be turned by a shift of wind into a dangerous berth necessitating an immediate move.

In this connection the fly sheet over the lowered mast plays a very important part. If the shift is likely to be a difficult job, and action is taken in good time, and rain is pouring down, the first thing to do is to bag and stow all the bed gear and other things in the canoe; dress in rain suit, and then proceed to strike and stow the tent; all this is done under shelter of the fly sheet. Then the work of stowing the fly sheet, the crutch, the lamp, etc., and setting up the mast is, as the novels say, the work of a moment. But on a dark, wet, and windy night the success of this stowage depends on all fittings having been well planned and no lashing to undo.

Turning now to the drawings, Fig. 1 shows practically a longitudinal section of the Nautilus, one of the R. C. C. sailing canoe class. In such a sketch, which is mainly intended to show general principles rather than detail, it is difficult to keep detail from becoming confusing, except to experts. In the rigging portion only the bare spars and the forestay are shown, but all the gear, shrouds, etc., would just be held in position by a tye put around all half way between the tabernacle and the crutch. Fig. 2 shows the tabernacle: A is a birdseye view showing how the spinnaker boom sits on one side to allow lowering of the mast; the locking heel bolt of the mast is put there to ease the strain on the stay or in case of accident to the stay when sailing. The tabernacle is merely a three-sided and open fore-side box, strengthened with internal block pieces at deck and heel, and with brass plates at top and at deck for trunnion and bolt respectively. When lowered to and beyond the position shown in the drawing, the trunnion bolt has a lateral play allowed so that the mast and all spars and gear lie down to deck at an angle of about 10 to 12 degrees; the object of this is to give working room in the cockpit for paddling or for fishing. The crutch, Fig. 3, is a brass jaw fitted to a flat sectioned spar just of a size to fit into the rudder case, with a pair of shoulders to take the deck edge of the case; it is set up by a guy and small tackle to an eye bolt on the taffrail. The tent ridge rope hooks on to a flange eye of the jaws. The lamp staff ships into brass or leather sockets, as shown; the staff and ring being the fishing landing net handle and collapsible ring. The lamp is the ordinary boat lamp, the lower part of which, shaded black, contains the green and red glasses for sailing lights. An all-round white light is enough to show in most places, but in navigating the lower Thames, or any much frequented water, it is better to keep the lamp below deck, and to exhibit the proper colored light by hand in due time.

Various fabrics for tents have been tried for years past, each of which, while new, has been satisfactory: but undoubtedly the medium union silk tent of this year, 1903, appears to give the best results, especially in its non-wettable quality. Green Willemsden canvas has been tried, but it is heavy; the green color is very pleasant when the sun comes out bright and hot in early morning, but we have had but little of that state of things this year. Once it gets wet through, the canvas takes a long time to dry, and when wet it is hard and heavy. Fig. 4 shows the tent, as to its seams, from a port corner or quarter view. The roof is preferably of much stouter stuff than the walls. A dressed rope is sewn along the roof ridge, and it is fitted with a large brass snaphook at fore end, to snap on to the boom gooseneck pin (see Fig. 2); the after end is a plain hook to hook into the flange eye of the crutch jaws. The bottom edge, all round, has a curtain flap, A, about 3 in. of light union, to lie on the deck, and prevent drafts and splashing. The four transverse broken lines B across at the lower edge of roof represent wood or bamboo stretchers, shown out at B2; these are fitted with a round headed brass screw in each end, which ships into an eyelet hole sewn in the broad hem (see Fig. 1). The door curtain travels by rings on a brass wire, within a doubled wall edge or tabling, a bamboo spreader, with a brass eye at each end, being let into a broad hem or pocket at the bottom of the door curtain, keeps it steady and stretched; the door can be tied up or down.

The window shown in Fig. 5, and C in Fig. 4, is a triangular cut in the rear wall, with a tabled edge. To the sides is sewn a window cover of ridge triangular form, with a rope becket at its point and a hook at its top. A shows it hooked open; B shows it down for rain, yet ventilating; C the same but a side view, and there can be a hook at side as in B for hooking the window close on a stormy night. A small bamboo strut is generally used with the becket to stand the cover out, as in C. The window must be in the position shown in Fig. 4, because if it were put above the stretcher it would have to be in the middle and would come against the crutch spur; and it would be too high for convenient look out. The lamp can be unshipped by hand via the window, but a more convenient way is to unship, say, the port end of the after spreader and the port aft corner deck hook, and stand up through the door, the after part of the tent being partially collapsed. A window of similar build, but smaller, can be fitted in the fore end; but it is not necessary and gives a bad draft to the lamp in the cooking basket, which stands over the center plate.

With regard to the boat, it would certainly surprise

any man who has not tried one to see what a comfortable amount of personal space and gear stowage there is in one of these Royal C. C. canoes. In Fig. 1, AA is the after watertight locker, bulkheaded off from the "well," and only divided in its after part by the rudder case. The hatchway thereto, shown dotted, forms a seat, convenient for changing clothes, and is, of course, within the tent. The "well" extends from that aft bulkhead to the forward bulkhead, which supports the centerboard case and a bucket well, or troughed deck, in which the two fore hatchways are fitted, one on each side of this slanting well. The fore compartment B extends from the fore bulkhead to the stem, and it is only partly interfered with by the center plate case and the mast case. The small hatch in the deck just forward of the mast is for putting the hook of the slings into the eye bolt in the keel, the other slinging eye bolt being at aft end of well, close to the bulkhead. Canoes so fitted can be hung on the ordinary yacht's davits by a short sling of rope and hook to come above deck and take the ordinary davit tackle, or they can be slung by a wire rope sling with ring amidships and fore end led through well hatch and hooked or shackled to the two keel eyebolts. This form of sling can be put on in a few moments when afloat alongside a steamer or a railway pier; provided, of course, that the bolts are in the keel and the slings have been provided and are in the boat. In slinging for a steamer or railway crane hoist, it is best to have the mast up and the center plate down, that is, until just landing on deck of steamer or into truck; it keeps the canoe steady upright. By the way, the slings should be tested to nearly double the weight of canoe and man before using, because the crane men are apt to give such a terribly sudden jerk in lifting.

One word, perhaps, is necessary as to setting the tent when afloat. The ridge is snaphooked to the mast gooseneck pin and to the crutch and then set taut; one side is then fastened down to the deck, then the other side, and after that the roof spreaders are put in. With a plain center plate it is advisable to keep it down all night, a tent of the size shown holds a lot of wind when struck abeam; but with a bulb keel, if there is any question as to available depth of water, the bulb can safely be kept just below the canoe's keel, but ready to be lowered away if a squall strikes her. The spars, mast and all, are hollow built, and though somewhat large in appearance, they are extremely light. She sets, with the cruising rig shown, a gaff mainsail of 84 sq. ft., clutch roller reefing, and a roller foresail of about 30 ft. Such an amount of sail will be, and has been, found ample for any open water or large loch cruising; indeed, it would be too much but for the heavy bulb on the center plate, that is, when cruising in the vicinity of high land.

The rudder can be lifted entirely through the boat; but when it is up the canoe will not lie so quietly and will sheer badly, except in some conditions of tide and wind, so it is necessary to use the rudder in different ways even when at anchor. The rudder mechanism was fully described, with drawings, in the Field of Jan. 3 of this year, and the roller reefing gear was described on March 14; since then it has been tested in every condition of wind and sea, and has thus far been faultless.

The tent above described was made by Jackson, the sailmaker, of Norwich, from large scale drawings, and, of course, to fit my boat; but as the R. C. C. class boats are so much alike the same drawings would suit any boat in the class, and Jackson has permission to reproduce the tent for any one. The scale on this drawing will give the governing size, but the detail of make is too voluminous to attach to a mere descriptive drawing. Many little fittings have, since the tent was first tried in the spring, been put on with intention of bettering; one, for instance, is that the four-corner deck fastenings are effected with small brass coil springs, Woodnutt's, so that wet or dry, there is always sufficient tension to keep a taut wall, and a small pull on the after guy tackle sets all up rigidly.

The internal fittings, the bed, the mode of stowing stores and clothes are, of course, all the result of lengthy experience, but that they suit one man is no certainty that they will suit others. One main difficulty is carrying and keeping good water. Tanks prove expensive, a great trouble carrying on shore, to fill, to stow, to draw water from, and to clean. So I have used lately only tin cans with screw tops and washers. Then there is the trouble of an effective yet safe cabin lamp; a dull oil lamp is miserable, and generally stinks; stowing oil is a trouble, and sure to be leaking. The boat lamp burns Sera wax, nice, clean stuff to stow, but thus far not used often enough to report upon. Many men recommend acetylene for all lamps, but questions arise, has it been tried inside a tent? and what risk of a blow up, also as to smells. Acetylene gas certainly gives a magnificent light in bicycle and motor car lamps. However, the yacht pattern of spring candle lamp takes a lot of beating.

These points, though interesting, are mere questions of comfort, and are quite secondary to the first wants, viz., an efficient boat fitted with a reliable tent, and as much solid camp comfort as can be got in so small a craft as a sailing canoe.

W. BADEN-POWELL.

CANOEING NEWS NOTES.

The annual election of officers of the New York C. C. and its general meeting took place at the Arena, West Thirty-first street, on Thursday evening, December 10, with the following result: President, Woolsey Carmalt; Secretary, Ashley Bigelow, 100 East Seventeenth street; Treasurer, Robert S. Hawthorne; Captain, John R. Brophy; Mate, William Yelland, Jr.; Trustees—Richard S. Foster, Elbert A. Bennett, Louis S. Tieman; Auditing Committee—Daniel B. Goodsell, Frank C. Hoyt. The club, now in its thirty-third year, has just closed one of its most successful seasons from the point of view of both racing and cruising. Its members cruised on the Delaware, the Millstone, and St. Lawrence rivers, in northern Canada, the Shrewsbury and other localities; eleven members attended the annual camp of the A. C. A. at Sugar Island, and, incidentally, won a number of races, while the club took an active part in the races of the

Gravesend Bay Yacht Racing Association as well. Plans are under way for extensive improvements to the club's property, foot of Harway avenue, Bath Beach, Brooklyn, on Gravesend Bay, and the members can confidently look forward, under the present conditions, to another banner year.

Henry Stanton, Commodore of the American Canoe Association in 1890, and, as such, in command of the splendid camp at Jessup's Neck, Peconic Bay, in August of that year—the largest in the Association's history—died at the Hotel St. Andrew, New York, on Saturday, December 5, 1903, in the sixtieth year of his age. Mr. Stanton joined the Knickerbocker Canoe Club in 1885, and was at different times its secretary and commodore. He was also Vice-Commodore of the Atlantic Division in 1889, and organizer and one of three members of the famed "I. C. A." His many old friends in the A. C. A. will sincerely mourn for him, and with his widow in the sad loss she has sustained.

Trapshooting.

Fixtures.

Dec. 25.—Utica, N. Y.—All-day shoot of the Riverside Gun Club. E. J. Loughlin, Sec'y.
Dec. 28-31.—St. Joseph, Mo.—First annual Interstate tournament. Managers, F. B. Cunningham, St. Joseph, and Chris. Gottlieb, Kansas City.

1904.

Jan. 1.—Indianapolis, Ind., Gun Club amateur tournament and contest for English Hotel cup; Fred Erb, Jr. (holder), against Ed Voris. Jas. W. Bell, Sec'y.
Jan. 1.—Poughkeepsie, N. Y., Gun Club second annual tournament. A. J. Du Bois, Sec'y.
Jan. 12-15.—Hamilton, Ont., Gun Club tournament.
Jan. 18-23.—Brenham, Tex.—Sunny South Handicap.
Feb. 22.—Lexington, Ky.—Jefferson County Gun Club.
Feb. 23-26.—West Baden, Ind.—Colonial Handicap. Targets and pigeons. Open. \$500 guaranteed. John L. Winston, Mgr.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

For the Phellis trophy, the Urban, O., Gun Club has challenged the Cincinnati Gun Club to a team contest to be held on Dec. 30.

The many experts, shooters and missionaries, of the Winchester Repeating Arms Co., were visitors in New York several days last week, under the able leadership of Mr. Irby Bennett.

In the championship shoot of the Highland Gun Club, Germantown, Pa., held at Gorgas Station, Messrs. Myers and Harper tied on 17 out of 25. In the shoot-off Harper won by a score of 11 to 7.

The Franciolo cup will be shot for by the members of the Sheepshead Bay, L. I., Gun Club, on Dec. 25. The Ira McKane medal for 1904 is for six competitions at the monthly shoots of the club, and the member who wins it the most times becomes the owner.

Mr. C. G. Grubb writes us that "all gun clubs in western Pennsylvania are requested to have one or more representatives present at the annual meeting of the Western Pennsylvania Trapshooters' League, to be held at the office of the Sportsmen's Supply Co., 623 Smithfield street, Pittsburg, Dec. 29, 1903, at 1 P. M."

On Jan. 1, on the grounds of the Indianapolis, Ind., Gun Club, a match has been fixed to take place between Mr. Ed. Voris, of Crawfordsville, Ind., and Mr. Fred Erb, of Indianapolis. Some other interesting open events have been arranged by the club to take place on that day.

Mr. J. G. Ewing, of the Dupont Company, Wilmington, Del., writes us as follows: "We are sorry to announce that the entire issue of Dupont calendars has been exhausted. There has been such an enormous demand for these that we will have to refuse any further applications, no matter how much money is inclosed for a calendar."

The Brooklyn, L. I., Gun Club will hold a shoot on Jan. 1, commencing at 1 o'clock. The grounds are situate on Kaiser's Farm, Old Mill Road. Take Kings County Elevated to Crescent street Station. Mr. John S. Wright will manage in his usual energetic form. The club will also hold a shoot on Christmas Day.

In a contest at 100 live birds between Messrs. A. A. Felix, of Philadelphia, and A. J. Miller, of Camden, for \$100 a side, at the Point Breeze race track, near Philadelphia, Dec. 19, the result was a tie on 83. Neither was in his usual good form. As a result of a contest resulting in a number of exceptionally perfect goose eggs, Messrs. A. J. Miller and John Morris contemplate a match at 100 live birds on Jan. 2, said to be for \$200 a side.

The programme of the Indianapolis Gun Club amateur tournament, fixed to be held on Jan. 1, provides ten events of 10 targets each, \$1 entrance. The purses are to be divided 30, 30, 20 and 20 per cent. Targets, 2 cents. Contestants may shoot for targets only. Shooting commences at 10 o'clock. Turkey dinner. The English Hotel cup contest, 100 targets, Fred Erb, Jr. (holder), Lafayette, Ind., against Ed Voris, Crawfordsville, Ind., will be an interesting feature. Reduced railroad rates.

The first annual Interstate midwinter tournament, to be held at St. Joseph, Mo., Dec. 28-31, provides twelve events on the first day, eight at 15 and four at 20 targets, \$1.50 and \$2 entrance, \$5 added to each event. On the second day, there are nine events at 15 and 20 targets, and a five-man team target race. On the third day the first annual midwinter handicap at 25 live birds, \$20 entrance, handicaps 27 to 33 yds., will be shot. The Wyeth challenge trophy goes to the winner. The fourth day's programme is a five-man team race at live birds. The managers are Messrs. F. B. Cunningham and Chris. Gottlieb.

Pilfering Cartridges.

HAVING lost a good many hundred cartridges in this way, I have come to the conclusion that the only plan is to risk being thought mean, keep your magazine locked, fill your bags yourself, put back in the evening what the day's shooting and your cartridge carrier has left you, and grin and bear the loss of the rest. Servants are very apt to fill the bags over weight, and leave them in the gun room. And many men have their cartridges sent direct from the gun maker—the box is opened by the keeper and left for any one to help himself from.

At a big shoot, if the keeper takes twenty cartridges a day, from five or six of the guests, they probably do not miss them, and he is a considerably richer man by the end of the season. There is not much difficulty in disposing of them. I once asked about some cartridges in a country town; the gun maker said if I would take "motleys" he could sell me some at a very low figure. On my asking what they were he pulled a large box from under the counter, full of cartridges of all colors and makes. I refrained from making him add to his sins by telling a lie, so did not inquire where they came from.

Grouse driving, I always put my bag on the top of the butt when the drive is over. I once left my spare bag, full, inside, and on returning with my loader from picking up the birds, found several of the drivers resting around the butt, my bag half empty; of course none of them knew anything about my bag, and I ran short before the end of the day.

It is little use complaining to the host, it is only a worry to him; he cannot play the detective, and hide in the gun room cupboard. All he can do is to tell the keeper he must stop it; the keeper agrees, but the practice continues. Considering that keepers, beaters, valets, perhaps sometimes your fellow guests, rob you of cartridges, it is only wonderful you do not oftener run short in a week's shooting.—Another Sufferer, in Field (London).

[That there are so many absent-minded beggars in England, one of the oldest and most civilized countries, is a source of deep regret. The Field's correspondent, however, must be mistaken in referring to the amiable lapse as robbery. In this country it is never so designated. In this country at tournaments, similar happenings, under tournament circumstances, occur, but they can be construed in two ways, namely, that the taker desires to pay a modest compliment to the excellence of the ammunition and its owner's judgment by securing a few boxes as souvenirs, or that he sometimes, when preoccupied with mental divisions of the moneys, helps himself in a fit of abstraction to the ammunition of his fellows—all cartridges look so much alike! The astonishing feature concerning the English collectors of cartridges is that they take lots so small that they can be counted.]

Tower Trap.

PINEHURST, N. C., Dec. 19.—The equipment of the Pinehurst, N. C., Gun Club, embraces a decidedly unique and interesting feature in the shape of a Tower trap. The traps are quite common in Europe, but practically unknown in this country. The interest shown in this trap, however, is conclusive proof that the innovation is to be a permanently popular one, which will soon be generally adopted by gun clubs throughout the country.

In the top of the tower are two expert inanimate target traps, one each at the right and left, as the shooter faces the traps, the attendant is protected by a heavy plank partition, which also hides the traps from view, and the traps are pulled from the rear in the usual manner.

Five birds may be thrown, right, left, unknown, overhead, and doubles. In all of these events, with the exception of the overhead birds, the shooter faces the tower at the usual distance. In the overhead shooting he stands back to the tower and directly underneath it. It is needless to say that the sport furnished is, to say the least, novel as compared with the usual trapshooting.

The idea is to produce conditions such as those the sportsman experiences in wild water fowl, pigeon or other similar shooting, or in shooting birds which fly from trees, and the tower was of course a natural consequence in Europe, where birds are driven to the waiting sportsmen.

Known angles to the right and left, are not difficult, and many have a "knack" for killing overhead birds; but unknown angles puzzle the experts, and doubles, two birds shooting off in opposite directions, and at the same time, call for a skill and quickness that few possess. But doubles are not impossible, and the shooting is wonderfully fascinating because of its difficulty.

TAR HEEL.

Wilmington Country Club.

WILMINGTON, Del., Dec. 15.—Appended are the scores of a shoot held at the Wilmington Country Club, Saturday, Dec. 12. A five-man team race was shot, Mr. Victor du Pont, Jr., being captain of the winning team, and Mr. Alexis L. du Pont captain of the second team. The same scores apply also to a two-man team race, the teams being as follows:

Alexis L. du Pont and L. Z. Lawrence.
L. J. Squier and J. G. Ewing.
E. E. du Pont and Victor du Pont, 3d.
L. D. Thomas and E. C. Ferriday.
Victor du Pont, Jr., and O. Kemp.

Targets: 15 15 20	Targets: 15 15 20
V du Pont, Jr. 12 17—41	A L du Pont... 14 15 19—48
L Z Lawrence... 15 15 18—48	L J Squier... 14 13 19—46
E E du Pont... 10 11 16—37	L D Thomas... 13 12 11—36
V du Pont, 3d... 13 13 14—40	J G Ewing... 9 10 15—34
E C Ferriday... 12 10 16—38—204	O Kemp... 8 9 12—29—193

Ossining Gun Club.

OSSINING, N. Y., Dec. 16.—Conscious of the great loss to the community and to the fraternity of sportsmen in general, it is with sincere regret I announce the death of James T. Blandford at the advanced age of eighty-three years.

Mr. Blandford was a beloved member of this club. While not active as a shooter owing to failing eyesight, he was, nevertheless, ever advancing the welfare of the club and its members.

From the time of muzzleloaders and black powder to just a few years ago, he was foremost in this State as a live-bird shot, his greatest pleasure being trips afield with dog and gun.

This club extends to its captain, Charles G. Blandford, the sympathy of his fellow members in his great loss, and desire that this be spread upon the minutes of this organization.

J. CURRY BARLOW.

SIDE LIGHTS OF TRADE.

Mr. Le Roy Leach, of Wood Lake, Neb., on Nov. 19, at King's Mills, O., shot at and hit 1,100 shotgun shell heads thrown at a distance of 25 feet. On Nov. 29, at Cincinnati, he hit 1,601 blue-rock targets thrown at a distance of 30 feet. He used Peters .22 short cartridges loaded with King's Semi-Smokeless powder and a magazine rifle that was not cleaned throughout the entire shooting.

The Marlin Firearms Co., New Haven, Conn., writes us as follows: "Our Marlin, 1904 desk calendars, we think you will agree, surpasses those of previous years in artistic merit. Framed with a rich blue, relieved by white scrolls, is a fine looking sportsman, with gun, peering through the long grasses for game. In the distance is a nice bit of landscape, brightened by the rays of the sun. The colors are beautifully blended, the subject remarkably fitting and attractive, and the framed effect unique. We will gladly mail this desk calendar to any of your readers who will send stamp and pay postage."

The Seaboard Air Line Railway, of which Mr. Charles B. Ryan, Portsmouth, Va., is general passenger agent, has issued an attractive calendar, which bears a picture, the central figures of which are an aged negro and negress, "uncle and mammy." She has taken his arm, and he is gallantly raising his hat in friendly greeting. The features of each express benignant welcome. It is entitled "Through the Heart of the South."

Spratts Patent (America) Limited, Newark, N. J., is illustrated with themes of interest to fanciers of dogs, rabbits, poultry, cats. It suggests the kinds of foods for the pets, and the medicines with which to treat them when ill.

The Laffin & Rand Powder Co., New York, have issued a neat folding calendar for 1904, beautifully illustrated. There are scenes pertaining to the rifle range, big game shooting, the pistol and the smooth bore.

Dec. 8 W. B. Powell, of English, Ark., won the live-bird State championship from R. W. Larkin, at Stuttgart, Ark., killing 25 live birds straight. He shot Winchester factory loaded shells.

Mr. S. M. Van Allen, at Guttenberg, N. J., Dec. 9, killed 20 live birds, making the only straight score. He used U. M. C. factory loaded shells.

There has been quite a bit of discussion, pro and con, in the New York sporting goods district, relative to live-bird shooting in the State of New Jersey. The expediency, not the ethics, was the subject of debate. So long as it is not illegal, any one has a right to organize a shoot in his own way, time and place. If live-bird shooting is to be stopped by legislative act, let it be so in its own good time. In the meantime, it is not well to admit indirectly, by concealment, that such shooting is wrong.

Rifle Range and Gallery.

Rifles and War.

ARGUMENT on behalf of bill to enable the Government to increase its source of supply of military rifles by an appropriation for the purchase at the private armories of a quantity sufficient to warrant them in equipping a plant of tools for their manufacture, always ready to respond quickly to the call of the Government in emergencies or otherwise.

The Governments of England, France and Germany have for many years fostered and encouraged the private manufacture of military arms and munitions of war in their respective countries by distributing among them a large proportion of the annual appropriations for the manufacture of service weapons, thus securing the resources of these private plants as an important auxiliary to the resources of the Government factories. Following the custom of previous years, the British Government has recently made a contract with two of the private arms manufacturers in Birmingham for a great number of the new rifles lately adopted for the use of the British army; these arms being in addition to those to be made at the two large Government armories of Enfield and Sparbrook. Each arms factory, according to its capacity, will furnish its proportion of the total requirements, neither the Governmental nor the private establishments being unduly favored. The present policy is to maintain so far as possible, all the sources of supply of war munitions, instead of crippling the private manufacture as before, by concentrating the orders in time of peace in Government arsenals, and thus precluding expansion to meet the demands of sudden emergency.

This was our trouble during the late Spanish war. Early in the campaign, the Chief of Ordnance was at a loss to supply our troops with even a comparative small quantity of the Krag-Jorgensen magazine rifles. He accordingly endeavored to negotiate with one of the principal private armories in the country for a large quantity of those rifles, but found from twelve to fifteen months would be required in which to produce the tools and fixtures alone for the manufacture of the service weapon. Thus the overtures had to be abandoned, and the Government continued to distribute the Springfield single-loader with black powder cartridges, with what criticism is yet fresh in the public mind.

The experience of our Government at the outbreak of the Civil War is another case in point. To meet the sudden and enormous demand for small arms, the arsenals of Europe were emptied of their antiquated and discarded weapons, and there was no gun so hopelessly condemned by expert opinion that it could not find a purchaser at an enormous price in the United States Government. We had the pleasure of selling some of our own discarded weapons to a foreign purchaser when the hollow sham of the Napoleonic Empire was exposed and France was found but partially armed in the presence of her enemy.

When we need arms at all our need will be a serious one, and there will be no time to create arms factories. It is wise, therefore, to encourage them in time of peace to meet the emergency of war. The needs of our Civil War so stimulated the manufacture of arms, that this country led in that industry, and arms and ammunition were sold abroad by the million, adding correspondingly to the wealth of this country. Our resources for the manufacture of arms were then superior to those of any other country, and might have continued so had a more liberal spirit toward arms manufacturers prevailed at Washington. Government monopoly is the destruction of private enterprise, as has been shown in this case.

The great disadvantage in which our Government was placed during the late Spanish war in procuring magazine rifles and ammunition, might have proven very serious had the war been prolonged; and the lessons made plain to them at the close, brought about wise measures increasing the capacity of the Government factories, now in process of development.

Ordnance officials, when asking for these increased appropriations have reported that the capacity of the two Government plants when finally installed, would together produce 650 of the new service rifles per day of eight hours, and be sufficient to meet any future emergency.

But it must be considered that it will take two or more years before any appreciable output will commence at either factory,

and several years before our whole army could at that rate be equipped. This would be making no provision whatever for the equipment of the thousands of volunteers that might be enlisted should war break out at any time, and all of them clamorous for the service magazine arm, which they have a right to demand, knowing that in this age they will be arrayed against armies equipped with modern magazine rifles and not single loaders. Besides, who can predict when the country will again be confronted with the emergency of war, and against what Powers we may have to contend? The situation might be such that we would be prevented from obtaining supplies from Europe, and if ever we could do so, the rifles would not be of same caliber as our own, which would mean that confusion would result in the distribution to our troops of cartridges of different caliber. A rearmament having been decided upon, it should be completed without delay. The old and new arms cannot be used together, for the same reason that the cartridges are of different dimensions and strength, and what would fit the new rifle cannot be used in the Krag-Jorgensen rifle. It would seem to be the part of wisdom for our Government to change its present policy of confining the manufacture of small arms to the Government arsenals, and adopt the method in vogue abroad of interesting the private factories, at least to an extent that will render them immediately available when wanted; and without which provision they cannot under any circumstances, no matter how urgent, respond to the call of the Government without wasting at least one year of valuable time in the manufacture and preparation of the tools and fixtures necessary to the manufacture of any new rifle.

New York Corps.

SEVENTY-ONE members of the New York Corps shot at the Zettler gallery Dec. 18. R. Gute was high on the ring target, C. Brinckama was first on the bullseye target. The next shoot will be held on Jan. 8.

Ten-shot scores, two to count: R. Gute, 244, 241; Geo. Ludwig, 241, 240; J. Facklamm, 233, 235; B. Zettler, 238, 233; O. Schwanermann, 227, 243; J. N. F. Siebs, 237, 230; F. Facomre, 231, 235; J. H. Hainhorst, 229, 235; H. Haase, 234, 232; J. H. Meyer, 229, 225; H. D. Meyer, 222, 228; H. Roitger, 224, 229; G. Thomas, 228, 228; J. C. Bonn, 225, 232; A. W. Lemcke, 221, 228; Geo. Offermann, 226, 223; C. Schmetz, 213, 233; H. Reckmann, 225, 219; C. Brinckama, 225, 220; H. C. Hainhorst, 222, 222; J. G. Tholke, 221, 216; W. Schulz, 220, 218; H. Gobber, 209, 225; H. Heinecke, 226, 218; L. C. Hagenah, 218, 224; A. Evers, 222, 214; C. Mann, 213, 225; H. Nordbruch, 218, 225; M. J. Then, 215, 218; P. Hiedelberger, 224, 214; H. Decker, 222, 209; H. R. Conlan, 216, 216; W. C. L. Beversten, 210, 221; H. Koster, 208, 219; Herman Koster, 209, 219; F. Feldhusen, 217, 209; W. Dahl, 221, 206; H. Meyn, 206, 218; H. D. Michaelsen, 204, 220; C. Roffmann, 216, 210; F. Schultz, 218, 207; H. Quenten, 208, 215; H. Winter, 202, 219; H. Henning, 204, 217; A. Giebelhaus, 201, 215; J. C. Kruse, 202, 215; J. Jantzen, 211, 203; C. Konig, 207, 207; R. Ohms, 216, 207; J. May, 208, 203; E. F. Lankenau, 194, 211; H. Konig, 213, 192; J. Gobber, 154, 198; L. L. Goldstein, 197, 194; W. Schaefer, 207, 193; J. Paradies, 211, 199; H. Offermann, 202, 195; W. H. Kuhlken, 194, 174; G. Junge, 179, 199; D. von Glahn, 182, 181; D. Dade, 199, 204; Adolf Beckmann, 202, 195; H. Hovenberger, 185, 170; Gus Hagenau, 177, 181; N. Jantzen, 182, 162; D. Fecken, 146; 201; J. H. Grote, 166, 159; D. von der Lieth, 199, 197; Max von Diongio, 189, 207; J. H. Descher, 199, 228.

Bullseye target, 4in. carton, best center shot, by measurement, degrees: C. Brinckama 25½, L. C. Hagenah 30, R. Gute 43, H. C. Hainhorst 47, J. H. Hainhorst 50½, A. W. Lemcke 52, Wm. Schulz 52, H. Haase 56, P. Hiedelberger 62½, F. Schulz 68, H. Berckmann 70, R. Ohms 73, J. H. Descher 83, J. N. F. Siebs 84½, J. C. Bonn 85½, H. Koster 87½, W. H. Kuhlken 91½, C. Konig 93½, C. Schmetz 97½, G. Thomas 103½, J. H. Meyer 105, J. Paradies 118.

New York Central Corps.

THE New York Central Corps held its third shoot, winter series, at Zettler's, Dec. 16. There were twenty-three members present. R. Gute made the high score on the ring target: H. D. Muller was second. On the bullseye target B. Eusner was first and won the Muller prize.

Ten-shot scores, two to count, 25-ring target, distance 75ft.: R. Gute, 243, 239; H. D. Muller 242, 233; J. N. F. Siebs, 237, 236; D. Scharninghaus, 236, 230; F. Rolles, 230, 238; F. Schroeder, 229, 230; B. Eusner 234, 227; W. J. Daniel, 234, 229; C. Gerken, 226, 224; Geo. Viemeister, 221, 228; W. Wessel, 231, 210; F. Brodt, 221, 229; A. Ritterhoff 222, 202; F. Engelking, 214, 214; Aug. Rohde, 225, 203; H. Schrader, 216, 206; H. A. Ficke, Jr., 193, 206; F. Jaegers, 201, 211; J. Kack, 184, 194; A. Ihlenberg, 180, 195; G. Dettloff, 173, 169; J. Winters, 187, 157.

Bullseye target, 4in. carton, the best center shot to count, measurement, degrees: B. Eusner 39½, H. Schrader 40½, F. Rolles 41½, H. D. Muller 55½, W. Wessel 63, Geo. Viemeister 83½, Gerken 78½, W. J. Daniel 88, F. Schroeder 91, Aug. Rohde 93, R. Gute 95, J. Winters 99.

Zettler Rifle Club.

THIRTEEN members were present on Dec. 15 and took part in the Zettler Rifle Corps' contest for high scores and club honors. Geo. Schlacht was first for the best 100 shots, with a total of 2433. E. Van Zandt was second with 2431. Louis C. Buss made the best 50-shot score, his total being 1225.

Ten-shot scores, 25-ring target, distance 75ft.: Geo. Schlacht (100 shots) 2433, E. Van Zandt 2431, B. Zettler 2337, H. Fenwirth 2342.

Fifty shots:

Louis C. Buss 1225, R. Gute 1213, A. Kronsberg 1212, C. G. Zettler 1210, C. G. Zettler, Sr., 1199, H. Holges 1197, W. A. Hicks 1183, Geo. J. Bernius 1170, T. H. Keller, Sr., 1151.

New York City Corps.

THE New York City Corps held its second gallery shoot at Zettler's, Dec. 17. Seventeen members took part.

Ten-shot scores, two to count: A. Kronsberg 241, 245; O. Schwanermann 237, 237; R. Busse, 233, 236; J. Facklamm, 225, 242; J. Wagner, 234, 239; R. Bendler, 232, 228; B. Eusner, 223, 234; A. Frank, 219, 222; J. Keller, 219, 214; C. Schmidt, 218, 218; H. Radloff, 210, 218; R. Schwanermann, 216, 211; A. Wiltz, 199, 214; H. Vogel, 202, 203; C. Metz, 189, 201; E. Sonner, 155, 174; W. Heil, 182, 160.

PUBLISHERS' DEPARTMENT.

The beautiful calendar of the Horton Manufacturing Co., of Bristol, Conn., covering the year 1904, has just been issued. It shows a birch bark canoe on the shore of a lake, and a girl, in bathing dress and with a Bristol steel fishing rod in her hand, holding up and admiring a large bass, just from the water. The color and the feeling of the picture are thoroughly genuine, and for beauty and artistic merit this calendar must stand high among those of the year.
